It has been said that the dilatation of the blood-vessels is due to paralysis of the vasoconstrictors, to irritation of the vasodilators or to both; or, finally, to paralysis of the muscular fibers of the arterioles. It was shown by Cohnheim, however, and the fact has been substantiated by more recent workers, that the vasomotor nerves play no essential part in the phenomenon of dilatation in inflammation. Cohnheim said that "the vessels are wont, under the influence of the agents employed by us, to dilate very much more than is ever the case in paralysis of the vasoconstrictors or stimulation of the vasodilators," and he also called attention to the fact that if croton-oil were rubbed on a rabbit's ear, a considerable time might elapse before the evidences of dilatation appeared. If the nerves were active the dilatation should appear promptly and not be delayed. The reaction is delayed. Adami suggests that "section of all the nerves passing to any region of the body should have such an effect, that injury should be unaccompanied by the ordinary vascular reaction," were the nerves alone the cause. The reaction, however, occurs. Moreover, while it is true that an active hyperemia may be induced by removal of vasomotor influences, the congestion may be increased by the use of croton-oil or heat. The events occur in the same order and in the same degree, though at a different rate, if all nervous influences be excluded. Removal of nervous influences, therefore, has no essential effect on the vascular dilatation of inflammation, and the whole inflammatory process may proceed normally in the absence of nervous activities. So it appears that none of the phenomena of inflammation are governed by the nervous system, and that nervous influences have the same importance in inflammation as in other processes, namely, in merely modifying the process—increasing or decreasing the rapidity of its production.

Cohnheim believed that the phenomena of inflammation were the results of molecular changes in the vessel-walls, and definitely stated his belief in the chemical nature of the process. He said that a change of chemical character is undergone by the vessels in inflammation, and that this brings about atony of the muscular coat, which permits dilatation, increase in frictional resistance, and permeability. It was only many years after these statements were made that any definite information commenced to accumulate as to the actual course of events.

Gaskell and Langley have suggested that vascular dilatation "in muscle and perhaps elsewhere" might be due to products of metabolism formed by the activity of the tissue, and Gaskell, later, showed that lactic acid causes dilatation of the vessels of the frog and that even in very low concentration, acids tend to produce vasodilatation. Still later, Bayliss showed that lactic acid and carbonic acid were equally effective in causing dilatation of blood-vessels. Schwarz and Lemberger, and later, Ishikawa, showed that weak acids, which are produced as a result of increased cellular activity, bring about vascular dilatation. In 1907 the evidence had accumulated to such a degree that Verworn formulated the rule that "the increase of the blood-supply in a functionally active organ must be based on a physical self-regulation which takes place as a result of the fact that metabolic products of the tissue cells influence the cells of the vessel-walls in that part so that the vessels dilate and more lymph is formed."

---

[*] From the Department of Pathology, University of Cincinnati.

[*] In the following pages I have attempted to correlate a considerable amount of experimental data which has accumulated on the subject of vascular dilatation.

In 1912, Starling said that the great increase in the blood-flow through muscles during muscular exercise is probably brought about largely by chemical means. "It has been shown," he said, that "the presence of blood containing lactic acid or carbon dioxid causes a marked dilatation of the blood-vessels of a limb." Hooker called attention to the fact that carbon dioxid, in minimal effective amounts, always relaxes vascular muscle. Still more recently Markwalder and Starling have shown experimentally that carbon dioxid is directly effective in producing dilatation of the coronary arteries and of the heart itself. They have also shown that "the most potent agent in causing dilatation of the coronary vessels is nonvolatile metabolites produced by the heart muscle.[1]

It seems possible that the vascular dilatation of inflammation is merely an exaggeration of a normal process and that the differences which exist between the two are due to variations in the duration of the circumstances which condition the reaction, and in the intensity of the reaction. The matter may be stated in this way: When sufficient chemical damage is done to the vessel-walls to produce a dilatation of a certain degree, the same influence which conditions the dilatation produces other changes in the vessel-walls which permit of exudation. In other words, the dilatation is merely the expression of the action of influences which are acting, in point of time and intensity, beyond the physiologic limits. Under physiologic conditions the blood-flow is increased during the dilatation. Under abnormal conditions it is first increased and then slowed. It is only when the point of slowing beyond normal limits is reached that the process becomes pathologic. Under physiologic circumstances an increase of metabolites causes dilatation, and this effect is due to changes in the vessel-walls which make possible a more rapid flow of blood through the vessels, and an increased oxygen delivery to the tissues, together with increased water transport (as is shown by the increased lymph-flow). In inflammation the dilatation is more marked, is less transient, the blood-stream is eventually slowed, and, beside an increased water transport, there is also a movement of blood-cells which follow the stream of water through the vessel-walls.

Perhaps this may be stated as follows: After an injury to any organ or tissue the local conditions are such that increased metabolic activity is required. There is more than the physiologic amount of useless material to be removed. Some of this must be so changed, chemically, that it can be used as food by neighboring cells. Useless material must be carried away to the sewers of the tissues—largely the lymphatics. To do this work the healthy tissue-cells must increase their activities, and, as a result of this, there must be a local increase of metabolic end-products (metabolites), including carbon dioxid and other substances which latter depend partially on the tissue involved. Any disturbance of equilibrium in the tissues produces profound variations in the chemical activities of the cells, with the result that they overproduce substances which, reacting on the intracellular and intercellular substances, change their physical state. Even the movements of migratory cells are modified under such circumstances. It is such changes in chemical activity which lead to increased production of carbonic acid and lactic acid, which, as has been shown, produce vasodilatation.

Many writers, and most recently and most convincingly, Martin Fischer, have shown how acids influence water absorption and secretion. When tissue is destroyed and when metabolism is increased an accumulation of acids tends to occur. The presence of acid causes swelling of the protoplasm of all the cells in the zone of action. Vascular and extravascular cells and intracellular substance are alike involved. This swelling of the colloidal substances produces several effects: it leads to a decrease in tone of the musculature of the blood-vessels, and it increases the viscosity of the endothelium.[2] The loss of tone is the important factor in the dilatation of the vessels, for were the tone to remain normal it is probable that no more than a very transient dilatation would take place in any vessel possessing a muscular coat. A transient dilatation is a physiologic process. Loss of muscular tone depends, apparently, on physicochemical conditions in the muscle-fibers which render them less ready to contract. It amounts to fatigue, and is quite analogous to the loss of cardiac tone produced by fatigue of the myocardium, which results in cardiac dilatation. (After all, the heart is merely a modified blood-vessel so that what is true for other parts of the circulation should be equally true for it.) A fatigued muscle—cardiac, vascular, or skeletal—is more easily stretched than a normal one. It seems then, in the heart as in the blood-vessels, that accumulation of metabolites or lack of oxygen leads to conditions which are analogous to fatigue, and when in this condition the muscle-fibers are capable of being stretched by a normal blood-pressure or even by one which is lower than normal.

Dilatation of blood-vessels is due then to physical and chemical changes in the musculature which are produced by deficient oxidation and accumulation of metabolites including carbon dioxid. Normally this dilatation is more or less transient and is unassociated with exudation. In inflammation it is more or less permanent and is associated with exudation.

Following dilatation, in inflammation, the blood-stream becomes slower than it normally is in the absence of the inflammatory process. For many years this phenomenon has been attributed to increased frictional resistance between the blood (particularly the blood-cells) and the vessel-walls. It has been said, for instance, that the leukocytes act as though they were sticky. And yet no satisfactory explanation has been used to account for this stickiness. Still, it seems, the accumulated evidence makes it seem possible to discuss this phenomenon in more fundamental terms than was formerly possible, and to apply the physicochemical facts of dilatation to this question of slowing of the blood-stream.

In studying this phenomenon (of slowing) under the microscope one of the earliest things noticed is a moderate swelling of the endothelial cells of the capillaries, a swelling which resembles in some respects that seen when one adds a drop of dilute acetic acid to a suspension of cells of any origin. This endothelial swelling precedes, though briefly, the slowing. Somewhat later the blood-cells themselves begin to swell, and when both these phenomena of swelling are noticeable the stream has already begun to slow. This swelling is due to the presence of acids, which, as is well known, cause swelling of the colloidal substances of the tissues, including the intercellular substances. It is entirely possible that other substances than acids (urea?) may produce it. However that may be, it has been shown by many writers that the various acids which occur normally and pathologically in the tissues, are active in this respect. It seems to be true that in simple edema the swelling is due to the presence of various acids.[3] Bechhold says that edema fluid from which the carbon dioxid is removed is acid to phenolphthalein, and Strassburg and Ewald had previously shown that the carbonic acid content of edema fluid is higher than that of venous blood. Moreover, Hoppe-Seyler found, in similar fluids, valerianic, succinic, butyric and lactic acids. If this is true in simple edema fluids it is certainly equally true of the liquids present in such an abnormal process as inflammation, in which metabolism is modified to a greater degree. We should expect to find the same acids present in greater amounts, and we might expect to find others also, for instance, beta-oxybutyric and aceto-acetic acids.

---

[1] Kubota (Mitt. med. Gesellsch. Tokio, 1913, xxvii, No. 21) has recently said that the vascular dilatation occurring as a result of stimulation of the vasodilators is dependent on an increase in acidity in the products of metabolism (Ztschr. f. Biochem. u. Biophys., 1914, xvi, 194.)

[2] It is of course obvious that the question of viscosity in this connection is an extremely complicated one. Nevertheless, there is evidence that variations in acidity or alkalinity produce increases of viscosity in blood-serum and, therefore, in the tissue (cellular) colloids.

Many writers have shown that increases of carbon dioxid or decreases in oxygen in the blood are productive of cellular swelling. Limbeck says that the volume of the blood-corpuscles varies according to the carbon dioxid content. Koranyi and Bence commented on the fact that, in the presence of carbon dioxid, the blood-corpuscles take up water from the serum, and, recently, L. F. Henderson has stated the modern conception of the normal influence of carbon dioxid on the blood-cells. He says:

> In each complete cycle of the circulation there occurs a complete cycle of changes between the constituents of the corpuscles and the plasma. As the blood flows through the tissues and receives CO_2, the volume of the red blood-corpuscles increases from entrance of water coming from the plasma, chlorin simultaneously passing in the same direction. In the lungs, with the escape of carbonic acid, the process is reversed. There seems to be no doubt that this process is largely dependent on changes in reaction, accompanying changes in the concentration of carbonic acid.

If this be true in the normal process, the same features of cellular swelling must be more marked in the abnormal, especially since the latter are largely accentuations of the former.

It must be apparent that, aside from any changes in consistency, this cellular swelling must produce a purely mechanical effect on the rate of the blood-flow. For if endothelial cells and blood-corpuscles increase in volume then the blood-stream must be interfered with to at least a certain minimal extent. This is of some importance, because a maximum of oxygen is needed at the point of injury, and any decrease in the rate of the blood-flow will diminish the supply of that element. Araki and Zillessen have shown that every loss of oxygen results in increased production of acid.

There is abundant evidence that carbonic and other acids have other effects than mere increase in volume of the cells. The one which interests us at this point is viscosity changes. Bechhold says, in this connection, that acids bring about increased viscosity of albumin. He says, further, that the ionization of albumin is increased by acids, and that the albumin ion shows a higher viscosity than albumin in the undissociated state. Hoeber has brought evidence that increases of carbon dioxid in the blood run parallel with hydrogen-ion concentration, and Pauli and Handovsky have reported that ionization of serum albumin depends on hydrogen-ion concentration, which in its turn is the cause of increased viscosity. Adam found that saturation of the blood with carbon dioxid produces a maximum increase in viscosity, and he further found that if the carbon dioxid were replaced by oxygen, the viscosity would sink to a minimum, and again increase with carbon dioxid additions. Koranyi and Bence likewise showed that the viscosity runs parallel with the carbon dioxid content. Blunschy said that ventilation of the blood reduces viscosity and reported that although seven hours of skiing lowered the viscosity of the blood 14 per cent. one and a quarter hours of forced exercise in a closed room raised it 4.5 per cent. He also found that venous blood-corpuscles exhibited a higher viscosity than arterial ones. Determann and Hess demonstrated the fact that the blood was increased in viscosity during stasis. W. Ostwald states that a pure albumin, prepared from blood, reacts exceedingly promptly to small traces of acids. He has demonstrated that in albumin solutions the changes are enormous. For instance, an addition of 0.015 normal hydrochloric acid increases the viscosity from 1.0623 to 1.2937. He further says that the maximum increase occurs with 0.02 normal hydrochloric acid. With other acids the maximum is higher.

There are numbers of other citations that might be used in this connection. Those given will, however, suffice for the point. They show, I believe, that decrease in the rapidity of the blood-stream in inflammation is the result of two factors: increase in volume of the cells of the blood and of the endothelial cells lining the blood-vessels, and increased viscosity of the blood as a whole. It has been suggested that both these factors depend on abnormal production of carbonic and other acids.

During exercise, in the normal individual, the carbon dioxid production runs above the normal during rest. This increase is sufficient, as has been shown, to produce a transient vascular dilatation by which the oxygen supply is increased sufficiently to take care of the moderate acid increase, and to counteract it. In the inflammatory process, however, the acid accumulation is too rapid to allow of immediate drainage. The cells are rapidly affected, and the circulation is slowed. This results in still greater disturbances of oxidation and other acids than carbonic acid accumulate. These acids produce still greater changes in viscosity and swelling and eventually the circulation is completely stopped. The experiments of Amberg and Knox, Amberg, Loevenhart and Grove, and Loevenhart and Eyster, support this conception. Loevenhart and Grove produced evidence that the oxygen in such compounds as sodium iodosobenzoate and iodoxybenzoate is physiologically active and capable of being utilized by the body for purposes of physiologic oxidations, and, later, Loevenhart and Eyster showed that those substances give up some of their chemically active oxygen in passing through the tissues. Amberg and Knox showed that such substances reduce the inflammatory reaction when they are introduced into the circulation.

---

[3] If the recent statements of Michaelis (Deutsch. med. Wchnschr., 1914, No. 40, p. 1170) holds, then there is some basis for believing that normal water transport from the capillaries is a matter of variations in acidity. Michaelis says that while the blood maintains an exact grade of alkalinity ($H = 0.45 \times 10^{-7}$) the tissues are neutral ($H = 1.5 \times 10^{-7}$).

It is much more in evidence that sputa presenting a distinctly lymphocytic picture with a positive albumin content in the absence of tubercle bacilli speak very probably for tuberculosis, but in the absence of albumin in an otherwise positive lymphocytic sputum the evidence is not quite so conclusive and yet it points very strongly as being of tuberculous origin.

It may be of interest at this point to refer to a few case histories in which the sputum examination under the microscope gave a field in which the small mononuclear lymphocytes predominated, but with an absence of the tubercle bacillus or only an occasional one after many fields had been scrutinized, all controlled by a positive albumin content.

Case 1.—Miss F., aged 24, came under my care Feb. 14, 1912, a fairly well-developed girl, general appearance good, complaining of a slight pain in the back and a tired feeling, giving the following family history: Father aged 61 in good health; mother aged 60, well. Three sisters and one brother living and well. One brother died four years ago at the age of 30 from stomach disease and another died ten years ago at the age of 19 from some pulmonary disease, very probably tuberculosis. The patient states that she has never been sick excepting in childhood at the age of 3 when she had a severe attack of whooping-cough. As stated above, the patient's appearance was good, fairly well-nourished, skin normal, no cachexia. Physical examination on percussion gave a slightly higher note in the interscapular region to the left of the spine extending upward toward the left apex; over this area the resonance was slightly impaired and the whispering voice somewhat intensified; anteriorly above and below the clavicle the note was also somewhat higher; no râles, pulse 94, temperature 98.8, time 4 p. m. left pupil dilated; systolic blood-pressure, sitting, 100.

Diagnosis: Incipient pulmonary tuberculosis. Sputum Examination: In looking over many fields an occasional tubercle bacillus was found, but of all the most characteristic feature was the pronounced lymphocytic picture. Every separate field was full of the small mononuclears averaging about 90 per cent. of the total cellular element, and in addition by chemical examination the sputum was found to be massively albuminous. Patient succumbed in January, 1914, from generalized tuberculosis.

Case 2.—Mrs. McC. Physical examination warranted a diagnosis of pulmonary tuberculosis first stage and examination of the sputum elicited the following facts: Owing to the tenacious consistency of the sputum, it was necessary to mix it with an equal amount of distilled water, and from this diluted expectorated material, smears were prepared. All these smears when stained gave a most distinctly lymphocytic picture, the small mononuclears being everywhere greatly in excess. In looking over each field very carefully, no tubercle bacilli were observed, when in the tenth field a single bacillus, morphologically and tinctorially, was seen. Now by actual count 250 more fields were most carefully scrutinized, but not another single bacillus could be demonstrated, and besides the preponderance of small mononuclear lymphocytes, the sputum was found to be massively albuminous. I now began to entertain some doubt if I had really seen a bacillus. Might not that have been an artifact? To satisfy myself on that point, I submitted some of the sputa to the antiformin method of examination. To 10 c.c. of the diluted sputum, I added drop by drop pure antiformin until a clear solution was obtained; then 8 c.c. of 95 per cent. alcohol were added and the whole centrifuged and from this sediment a smear was prepared in which I found five distinct groups of bacilli with from four to six bacilli in each group.

Case 3.—Mr. W., formerly of this city but now residing in California, consulted me, June 25, 1912. Patient was in fairly good health doing an office business and at his desk every day. He had a slight hacking cough of about a month's duration and he requested that an examination be made and that a prescription be given to stop the cough. Pulse was 86, temperature 98. Physical examination gave slight evidence of a bronchitis. The sputum examination did not show a single bacillus in a careful scrutiny of innumerable fields, but everywhere there was a distinct lymphocytosis of the small mononuclears, besides moderate amount of albumin. Eight days after I injected 1 mg. Koch's tuberculin O. T. intracutaneously, which was followed by a most positive reaction. A sputum examination made from expectoration secured two days after this positive finding gave the same lymphocytic picture as in the sputum examined ten days before, with the same moderate amount of albumin; but in addition many tubercle bacilli, chiefly in groups, were demonstrable.

Case 4.—Miss V., aged 19, living out of town, first consulted me March 21, 1914. Physical examination permitted the diagnosis of pulmonary tuberculosis, slightly past incipiency. At that time the clinical picture was at variance with the physical findings, the patient being apparently a very well-nourished girl, but now the case is very active. At the first visit the sputum examination showed a most distinct predominance of the small mononuclears and in addition a moderate amount of albumin. This in itself was so pronounced and positive that the sputum was labeled as that obtained from a positively tuberculous person. After long and careful search I was finally rewarded by finding a single bacillus. By the antiformin method, I was able to demonstrate positively the presence of the tubercle bacillus; six were found in all, four singly and two in a group.

Case 5.—Miss M., nurse, aged 32, came first under my care in June, 1913. There were no cough, no pain and no loss in weight, only a little tired feeling. Pulse was 88, temperature 98.4. Physical Examination: Apex, right, posterior muscle spasm, harsh breath sounds, some sonorous râles; anteriorly right, fremitus distinctly increased, prolonged expiration, harsh breathing and a few fine inspiratory râles. A dry pleurisy developed which under immobilization of the chest wall with adhesive straps gradually subsided. Diagnosis: Incipient pulmonary tuberculosis with a secondary pleurisy. Sputum examinations at that time gave the following findings: Not a single bacillus could be found after examination of a countless number of fields, but a distinctively lymphocytic picture was everywhere plainly noticeable, and besides a moderate amount of albumin was present.

The parallelism between the lymphocytic sputum picture on the one hand, and the positive albumin content of the expectorations on the other, was so evident in all of these histories, and in nearly every one of the above-conducted chemical and microscopic examinations, that a fairly positive diagnosis of pulmonary tuberculosis could truthfully be made on these findings alone.

On the remaining sputum examinations, 55 in all, which were bacilli negative, the following observations were made: Seventeen did not show tubercle bacilli, albumin or lymphocytosis; consequently they were all labeled as sputum samples secured from positively non-tuberculous persons. In 36 of the remaining 38 specimens, a negative bacillus finding was recorded; of 2 no record can be found. In 4 of this series the sputum was too bloody to warrant an albumin test; in 7 others the albumin content was not recorded; the remaining all showed albumin in variable amounts, and as to the cellular constituents of the sputum of the last series, I can state that in 14 the lymphocytic picture was not clearly studied or accurately noted, in 5 a distinct leukocytosis prevailed, and the remaining showed no preponderance of either small or large lymphocytes or of leukocytes.

From these observations and studies made both chemically and microscopically on 199 samples of sputum secured from suspected tuberculous persons, it is reasonable to permit a justification of the following conclusions:

1. A sputum lymphocytosis showing under the microscope 50 per cent. or more of the small mononuclear leukocytes (lymphocytes) with a moderate amount of albumin by chemical test speaks very strongly for the presence of a pulmonary tuberculosis.
2. In preincipient or incipient cases of pulmonary tuberculosis a lymphocytic sputum is usually present with a greater or lesser albumin content; in this the tubercle bacillus may be entirely absent or only an occasional bacillus found.
3. The presence of the mononuclear lymphocyte in sputum in preponderant amounts and a positive albumin test, is simply the forerunner or near the beginning of positive findings, for the tubercle bacillus if not already present in the expectorations will soon be found.
4. In a sputum giving a lymphocytic picture in the absence of tubercle bacilli, a positive albumin content has been demonstrated; this is confirmatory evidence that the sputum is that from a person suffering from pulmonary tuberculosis, and hence:

A careful microscopic study of every sample of sputum under examination should first be made for either the presence or absence of the tubercle bacillus; if this is negative and with a preponderance of the small mononuclear leukocytes in every field with a positive albumin finding by chemical test, in moderate amount, we are justified in assuming that the source of this expectoration is that found in a positively tuberculous individual.

3033 Colorado Avenue.

MYIASIS OF THE URINARY PASSAGES

ERNEST F. KING, M.D.
WASHINGTON, D. C.

Myiasis is the general term applied to the occurrence of dipterous larvae in man. Though the larvae of many flies have been found, those most common are from the *Fannia scalaris*, the small fly frequently seen in the spring darting actively about under chandeliers or other pendent objects. A common name for it is "latrine fly," from its favorite resort.

This fly lays its eggs in dark, moist places, and the larvae may appear in from one to eighteen hours, depending on the warmth of the place of deposit. The larvae are full grown within from six to twelve days, but under favorable conditions, three or four weeks may elapse before they enter the pupal stage.

The literature on the subject is limited. Osler's "Practice" devotes a page to the general subject of myiasis, but does not mention its occurrence in the urinary passages. Stiles in Osler and McCrae's "System of Modern Medicine" gives up a few lines to the general subject only. The Library of the Surgeon General's Office furnishes but few titles.

Captain P. S. Lelean[1] collected a series of thirty cases. The earliest one was reported by Ambroise Paré in 1582. In most of these cases the larvae were believed to be those of the *Fannia scalaris* (formerly *Homalomyia*). He relates one remarkable case of myiasis externa. In 1842 an eminent London physician wrote as follows:

> I saw hundreds of worms escaping from the skin. The carpet was covered with them where she stood dressing. They had the power of ejecting themselves to a distance of from 12 to 20 inches.

In 1899 Lieutenant-Colonel Smith saw a dipterous larva spring 3 feet. The saltatory powers of the cheese skipper will be recalled.

Cipriani[2] reports the case of a woman vagrant, badly constipated, who passed dipterous larvae in quantities from the vagina. A rectovaginal fistula existed. Cipriani believed that the eggs had been deposited on food and hatched in the lower bowel. The hard fecal masses in the rectum had aided the larvae in producing an ulcer which had perforated the rectovaginal septum, allowing the passage of the larvae into the vagina.

René Chevrel[3] makes a careful analysis of all reported cases of myiasis of the urinary passages, and adds a case of his own. He concludes that only twenty such cases have been reported, six of which he regards as authentic, ten probable and four doubtful. His own case makes seven which are authentic.

He is of the opinion that while dipterous ova may be carried into the urinary passages by sounds or catheters, or in water used for irrigating, they generally are deposited about the meatus urinarius where are found the conditions favoring their growth, namely, darkness, moisture, warmth, oxygen and food, which last is furnished by a gonorrheal or other albuminoid discharge. The eggs hatch promptly and the young larvae pass into the urethra and on into the bladder in search of food. They require but little oxygen, and in the experiments carried out by Chevrel were kept under water for hours, becoming active when taken out. There is always some air in the urethra and probably in the bladder.

The contamination is favored by sleeping without cover in hot weather, flies having free access to the genitals and anal region. Women, wearing longer gowns than men, are less affected. On the other hand, women and children without proper underclothing are more liable to infection.

Chevrel's case was that of a paralytic of 55, wife of a farmer, who was left alone all day on a chair which had been converted into a commode by removing the seat and winding the framework with rags, the receptacle for the dejecta being placed on the floor and the flies being free to swarm at will about the buttocks. She passed larvae with the urine, daily, from May 19 into July.

REPORT OF AUTHOR'S CASE

Oct. 29, 1914, H. P., man, aged 32, living on a small farm in Virginia, who had been attending my service at Emergency Hospital, brought to my office an object that he had passed with the urine, which was later identified as a larva of *Fannia scalaris*. He had voided similar objects with the urine October 19 and 28, but had not brought them to me thinking that I would laugh at him.

This man had a chronic posterior urethritis and for some months had been in the habit of urinating in a glass when at home. This glass he kept in the shed at the rear of his house, turned upside down on a shelf, and it was always rinsed after using. He had been using a small syringe of hard rubber for urethral injections and had kept this wrapped in paper and in a closed drawer, so that, apparently, the larvae could not have been in the glass, nor the eggs or larvae in the syringe.

About 8 o'clock in the morning, while digging potatoes in his garden, he was seized with an intense desire to urinate, hurried to the shed, felt something pass with the urine and found the larva in the glass. He saw no motion. I received it two hours later and it was in a perfectly fresh condition.

[2] Cipriani: Il Morgagni, 1902, xliv, 384.

[3] Chevrel, René: Arch. de parasitol., 1909, No. 3.

He has seen no larvae since nor was he able to find any in the feces after diligent search.

Contamination probably took place while seated long at stool, the flies being attracted by the presence of a slight urethral discharge. That larvae were voided ten days apart would indicate that they were from different infections. The larvae had evidently penetrated the prostatic urethra, judging by the patient's sensations, though the cystoscopic findings were negative.

I believe that the patient's word may be relied on and that this may be considered the eighth authentic case of myiasis of the urinary passages.

I am indebted to Dr. L. O. Howard, entomologist of the U. S. Department of Agriculture, for the identification of the specimen and for the copy of Chevrel's article.

ADRENAL PRECOCITY

PRECOCIOUS DEVELOPMENT OF THE EXTERNAL GENITALS DUE TO HYPERNEPHROMA OF THE ADRENAL CORTEX

J. F. BALDWIN, M.D.
Fellow of the American College of Surgeons; Surgeon to Grant Hospital; Professor of Clinical Surgery, Ohio State University College of Medicine
COLUMBUS, OHIO

The case to be reported presents one of those rare conditions of childhood in which with the precocious appearance of hair on the face and pubes, and the equally precocious development of external genitals, there appears an abdominal tumor due to the growth of a hypernephroma of one adrenal body.

In an exhaustive article on this subject, with the report of one case, Jump, Beates and Babcock[1] have collected from the literature records of seventeen cases, their own case making the eighteenth. In all the cases the conditions present were verified by a more or less complete necropsy. Other cases they find reported, but without necropsy, so that the diagnosis is in doubt. In one case necropsy showed both adrenals apparently normal, but the necropsy was brief, and the examination evidently superficial. Of the eighteen cases reported, fourteen were girls and four boys. In all there was an overgrowth of hair on the pubes, in fourteen an overgrowth on the face and in five in the axilla. There was overgrowth of the body, due to fat or muscular development, in all; facial acne with rough skin in some; precocious menstruation and development of the breasts in only one. Pigmentation of the skin was present in many, but in none anything like Addison's disease. Some showed mental precocity, but the majority were dull. There was a tendency in all to the development of the male characteristics at the expense of the female in the girls, and an intensification of the male characteristics in the boys. In all of the cases the tumor was found to involve the adrenal cortex, and in no case was a tumor of the medulla alone found associated with this precocious development.

As showing the peculiar change in sexual development, one case is referred to of a girl of 16 whose menstruation began when she was 15 years old and ceased after one year. At this time she had developed a mustache and beard, and hair on her thorax. She became fat and her voice became masculine.

Of the eighteen cases reported, all patients died before they were 16 years old. Some were operated on and died shortly after. In others the growth was inoperable when the patient came under observation. Because of the hopeless character of the disease without intervention, the authors properly advise exploratory operation in the early stages of the development of the disease, hoping that the removal of the adrenal at an early stage might result in a cure.

REPORT OF CASE

T. R. F., boy, aged 5 years and 10 months, was referred to me July 6, 1914, by Dr. E. A. Moore, the family physician. In his letter arranging for the consultation the doctor referred to the precocious sexual development and to the presence of an abdominal tumor, the removal of which was desired. In reply to the letter I suggested that the case belonged to the rare class described in the journal referred to, and that it would probably be found inoperable. A few days later the patient came in, accompanied by his father and an uncle, Dr. N. F. Mason of Columbus. He was rather underdeveloped when born. The father thought the sexual development commenced when he was about 18 months old. He commenced to talk and walk at 9 months, and at 10 months he could talk well and "run like a partridge." After that his mental development ceased to keep pace with his physical. When he was 3 years old there was hair on the pubes and face, and he had a voice like a man, according to Dr. Mason. He was active and vigorous, and was quite useful in running errands. Probably in December, 1913, it was noticed that his abdomen was getting larger, and this enlargement continued and became quite rapid. The surface of the body became roughened, and covered more or less with sores, particularly on the chest and back, and acne developed on the face. The patient in height and weight was about normal for his years. The facial expression, however, seemed to be that of a man of 35 or 40. He had been shaving for some time. The face was badly marked with acne. There were great crusts over the upper chest and back. The chest looked very much as though it had been burned by Roentgen rays. The genital organs were apparently those of an adult, except that the testicles were small and not completely descended.

There was a large tumor in the abdomen, this being most pronounced on the left side. It was extensively adherent, and somewhat nodular. There seemed to be a second mass over toward the right, but no connection between the two could be determined. The legs were decidedly bowed, but this the father attributed to his walking so early. The child could utter some words, the voice being that of an adult, but he was mentally a mere child.

As the tumor was large and extensively adherent, and the child's general condition poor, it was evident that no operation should be considered and the child was sent home. While he was under my observation the urine was obtained, which was normal, though containing a faint trace of albumin. Blood-examination revealed; hemoglobin, 85 per cent.; red cells, 4,480,000; leukocytes, 14,000; polynuclears, 81 per cent.; small lymphocytes, 13.6 per cent.; large lymphocytes, 5.4 per cent.

The child's general condition remained about the same after his return home, but with gradual failure, and he died the morning of August 29. The necropsy was made by Drs. E. R. Shilling, pathologist to Grant Hospital, and H. M. Brundage, pathologist to Mt. Carmel Hospital, who reported as follows:

"Height 42 inches; chest measurement 24 inches, waist measurement 32 inches. Facial expression of a man of 40. Penis 4 inches long, with marked development of pubic hair. Testicles in the canal. Feet and legs enlarged. Linea albicantia distributed over the abdomen and around the ankles. The brain was removed, and appeared normal in every way. Pituitary body appeared normal, and was removed for sections. Thyroid and parathyroids small but otherwise normal; were saved for sections. In the abdomen was a large tumor, lying between the layers of the mesentery of the descending colon. On removal could peel the kidney out of its capsule and easily traced its vessels and the ureter along the capsule of the tumor. The kidney was evidently normal and functionating. The tumor weighed about 15 pounds, and measured 12½ by 9 inches with numerous small nodules protruding. On section the mass was very soft, well marked off into medulla and cortex, its origin evidently the left suprarenal gland. Right kidney normal, but its suprarenal gland was about the size of a walnut, red and friable. The liver was full of metastatic nodules. Other organs of the abdomen negative. The lungs contained numerous metastatic nodules. Other organs of the chest normal. Pieces of the tumor were removed for section."

[1] Jump, H. D.; Beates, Henry, Jr., and Babcock, W. W.: Precocious Development of the External Genitals Due to Hypernephroma of the Adrenal Cortex, Am. Jour. Med. Sc., 1914, cxlvii, 568.

Microscopic examination of the tissues by Drs. Coons, Shilling and Brundage showed the pituitary body and the pineal gland to be normal; also the thyroids and parathyroids. The kidney showed a chronic diffuse parenchymatous nephritis. The testicles were normal for a boy of his age. The large abdominal tumor was typical of rapidly growing hypernephroma, involving the adrenal cortex. The right adrenal showed a beginning hypernephroma similar to the left.

A SIMPLIFIED METHOD FOR THE INTRAMENINGEAL INJECTION OF NEOSALVARSAN IN SYPHILIS OF THE NERVOUS SYSTEM *

LOUIS M. WARFIELD, A.B., M.D.
MILWAUKEE, WIS.

Since Swift and Ellis[1] published the technic and the results of their method of introducing salvarsanized serum into the subdural lumbar spaces, there have been a number of reports from those using the original method and several modifications of the method, notably by McCaskey,[2] Fordyce[3] and Pilsbury.[4] There is no question that the technic is elaborate, not altogether free from danger (Lorenz[5]) and it gives no idea of the amount of salvarsan used. It is not known also what the combination of salvarsan and serum is which is injected.

Swift and Ellis found neosalvarsan solutions less irritating to monkeys when given subdurally. We found the same relation between the two drugs in dogs and in rabbits. Salvarsan, first used by us in very dilute solution, has been put aside for neosalvarsan, which seems far preferable for intrameningeal use.

Ravaut[6] gives neosalvarsan in hypertonic solution. He uses 0.3 gm. in 5 c.c. distilled water, which gives a solution such that 1 drop equals 1 minim. Of this he gives from 3 to 12 drops by means of a special syringe, diluting it with spinal fluid. This seems an unnecessary waste of a rather expensive drug, especially if only one injection is to be given. Wile,[7] in this country, has used Ravaut's technic with some success.

After a year's experience with the method about to be described, I feel justified in presenting it and recommending it. Ravaut's work was unknown to me until several months after we had used the method at the Milwaukee County Hospital and in private cases. In my hands the method has been most satisfactory, and, I believe, fulfils the requirements for simplicity and rationality of procedure. The patients, especially tabetics, often have an exacerbation of pains in the legs or of girdle pains, but these pass off over night, only rarely necessitating a hypodermic of morphin.

There can be no doubt that in order to render the maximum service to patients, treatment must not be so complicated that only a few exceptionally trained men in conjunction with well-equipped laboratories can administer it. It must ever be our aim to simplify therapeutic procedures so that many will be able to benefit thereby. The point in the treatment of cerebrospinal syphilis is to get the spirillicide drug to the infecting agent in the spinal cord and brain with the least harm to the patient but the greatest harm to the parasite.

It has always been our custom to inject neosalvarsan intravenously and intrameningeally at the same sitting. We have never given the latter alone except in one case of negatively reacting tabes in order to control the lightning pains.

TECHNIC

We require freshly sterilized 0.5 per cent. saline solution made from freshly distilled water; a sterile 25-c.c. glass-stoppered cylinder; a sterile 1-c.c. pipet and 10-c.c. pipet graduated in 0.1 c.c.; two sterile medicine glasses; a 20-c.c. sterile Luer syringe, with needle; a 10-c.c. Record syringe, sterile; a spinal puncture needle with stylet into which the end of the Record syringe fits, sterile; some form of arm constrictor, sterile sponges, towels, alcohol and iodin.

Nine-tenths gm. neosalvarsan is dissolved in 18 c.c. of the saline solution. One c.c. of this equals 0.05 gm. One c.c. of this to 9 c.c. saline is Solution 2. Four c.c. of Solution 2 to 6 c.c. saline is Solution 3. One c.c. of this contains 2 mg. of neosalvarsan. With all the materials and glassware ready these solutions may be prepared at the bedside.

With the 20-c.c. syringe the 17 c.c. neosalvarsan is given intravenously. The patient is then turned over on his side. Before the spinal needle is introduced 1, 2 or 3 c.c. of Solution 3 is drawn into the Record syringe. I usually do not give more than 2 c.c. or 4 mg. The spinal puncture is then made and as soon as the fluid is flowing freely the syringe containing the neosalvarsan is fitted to the head of the needle and gentle suction made until the syringe is full of spinal fluid. After holding a brief time the whole is *very* slowly and at the least amount of pressure injected into the meninges through the needle *in situ*.

(Note: Should more than 4 mg. be used the dilution can be made stronger as required, although 6 mg. has been my maximum dose and from 2 to 4 mg. the usual dose.)

ADVANTAGES

We claim for this method: (1) maximum of safety; there is no increase in pressure, no introduction of a large amount of foreign material, no shock from differences in temperature of the spinal fluid and the solution injected; (2) absolute control of dosage.

Several times a blood-vessel has been struck and the spinal fluid has been quite red in color. The injection of this blood-stained fluid has not resulted in one particle of harm as far as we could determine.

Injections are given one to two weeks apart, and the results and number of injections are controlled by serobiologic reactions of blood and spinal fluid.

141 Wisconsin Street.

A CASE OF ULCERATIVE PNEUMOCOCCUS ENTERITIS WITH PERITONITIS FOLLOWING LOBAR PNEUMONIA

Clara M. Davis, A.B., M.D., Lansing, Mich.

The following case is reported as being of interest because of the comparative rarity of the condition, the interesting operative findings and the recovery of the patient.

History.—S. P. T., a mulatto laborer of good habits, aged 56, was seen first, March 3, 1910. He had had typhoid fever in his teens; an operation for hemorrhoids at 30, and for ten or twelve years preceding the present illness, more or less "stomach trouble" aggravated by chewing tobacco, and characterized by gas, soreness in the pit of the stomach and attacks of pain under the right lower ribs extending through, beneath the right shoulder blade and to the right shoulder. These attacks were usually accompanied by huge hives. The patient had been feeling poorly all the fall and coughed a little. Family history as far as patient knew was negative as to tuberculosis.

Present Illness.—February 10, following exposure and chilling, patient had typical attack of lobar pneumonia involving the right lung; crisis occurred on the ninth day; since then he has coughed moderately and raised a fair amount of purulent sputum but has not gained any strength and has constant distress in his stomach with tenderness over the upper abdomen; bowels have not moved for two days.

Physical Examination.—Temperature 97.6, pulse 72, slightly irregular and rather poor quality; respirations 19. Patient moderately emaciated, sweating profusely, conjunctivae subicteric; tongue heavy yellowish coat, breath foul; chest shows slight dulness, increased vocal fremitus and bronchovesicular breathing over lower lobe of right lung; abdomen slightly below level of ribs; extreme tenderness in upper abdomen, especially in epigastrium to the right of midline, right hypochondrium and just above and to left of umbilicus.

Sputum examination showed only many pneumococci and pus cells, no tubercle bacilli. Leukocytes 9,800.

Urine examination was negative.

Treatment and Course.—Calomel, ¼ grain every hour for five doses, to be followed by a saline, was ordered and a liquid diet.

March 4, temperature was between 97.6 and 98.8, pulse between 78 and 85; bowels moved freely and patient vomited a large quantity of dark green bile. There was less pain and tenderness but increased weakness.

March 5, temperature 98.4; pulse 76, tongue clean, breath no longer foul; patient felt better.

March 6, temperature 99.3, pulse 88, respirations 20. Patient complained of great pain and tenderness in gall-bladder region, slight hiccup and mild distress in urinating. Three large herpes appeared on the lips. Abdominal examination showed tenderness as in first examination; urine showed neither albumin nor casts. Leukocytes 10,600. One brown liquid stool was obtained by enema.

March 7 and 8 there was no material change except for cessation of hiccup and less pain and tenderness. Herpes appeared on lips, border of tongue and pharynx. Bowels moved by enema; small brown, soft stool, some mucus.

March 9, patient much worse; vomited some dark blood, passed several black tarry stools; microscopic examination of stool showed an enormous number of pneumococci. Examination of patient showed temperature 98, pulse 104, respirations 22, peritonitic facies, scaphoid abdomen, with rigidity, especially in upper abdomen above umbilicus. Leukocytes 18,000, 75 per cent. of polymorphonuclears. Patient was removed to hospital and laparotomy under light ether anesthesia was done by Dr. L. W. Toles late in the afternoon, at which time patient's condition was poor. Pulse 120, temperature 98.4 and abdomen slightly distended.

Operative Findings.—The abdomen was opened by an incision in the gall-bladder region parallel and to the right of the median line, and the peritoneal cavity was found to contain a fairly large amount of thin pink-tinged fluid with a few fibrin flakes. Stomach was normal; gall-bladder small, dark and shriveled; liver very small and apparently atrophic. The small intestine throughout its entire length was thickened, intensely congested, almost hemorrhagic and the seat of numerous small acute ulcers showing as more deeply congested spots softer than the surrounding areas. These ulcers were most numerous in the upper part of the jejunum and decreased in number in the ileum, especially the lower portion. In a somewhat hasty examination no perforation was found and no ulcers were seen in the large intestine. Appendectomy was done, the abdomen closed and the patient left the table in very poor condition. Pulse 120 and of poor quality. Strychnin, 1/60 grain, was administered hypodermically, and normal saline was given on the table.

Postoperative History.—Eight ounces more of saline were given by rectum and strychnin, 1/60 grain hypodermically, as soon as patient returned from operating room. For the first four days patient's condition was very poor, hiccup being severe and almost continuous; from three to four black tarry stools daily; pulse from 100 to 116, temperature from 97 to 100; more herpes appeared in the mouth and in the alae nasi and lobes of the ears. Those on the tongue were particularly distressing.

March 13, six days after operation, right ear ached slightly for an hour, at the end of which time, discharge appeared. Cultures from this gave pure growth of pneumococci. Hiccup stopped on the fifth day after operation, melena after the eighth, and patient was discharged March 26, the seventeenth day, but was in bed at home for ten days longer, during which he complained of pain and tenderness in the wrists and ankles. The herpetic vesicles along the tongue developed into shallow ulcers, which were extremely painful and did not clear up for several weeks longer.

Three months later patient had regained his normal weight, 150 pounds, and was able to go to work.

The condition was not correctly diagnosed prior to operation. The history suggestive of gall-stones and chronic cholecystitis made an acute cholecystitis of pneumococcus origin seem probable, but with the appearance of melena, duodenal ulcer had to be considered. The peritonitis could have been a consequence of either, and therefore gave no aid to diagnosis. Not enough importance, it is probable, was attached to the rather profuse appearance of fresh herpes during the early days of the illness. Also since the gastrointestinal complications and sequelae of lobar pneumonia have received rather scant attention in description of that disease, the possibility of pneumococcus enteritis did not occur to the observers.

AN UNUSUAL CASE OF SCREW-WORMS IN THE NOSE AND NASAL ACCESSORY SINUSES

George U. Huber, M.D., and Frank L. Flack, M.D., Coffeyville, Kan.

J. M., farmer, aged 66, was referred to us Oct. 5, 1914, for hemorrhage of the nose. This patient had had trouble with his nose for several years. One year ago last August his nose began to discharge and became very sore. About this time a traveling medicine man came through his part of the country selling an inhalation powder for treatment of diseases of the nose. He purchased a large amount of this medicine for use and to be doubly certain of a cure traveled with the medicine man for several months and took treatment under his directions.

At varying intervals large masses of necrotic material were discharged from his nose. Following this he was relieved. Up until two weeks ago his condition had remained about the same. At this time a fly went in one nostril and came out of the other. Following this trouble he became rapidly worse. October 2, he felt something moving in his nose and called a regular doctor who saw him several times and gave him treatment. This was of but little benefit. Finally the doctor injected chloroform and removed seventy-two Texas screw-worms. The patient's condition remained serious and he was brought to the hospital for treatment. At this time a Wassermann test was made which was strongly positive.

Under general anesthesia the following conditions were discovered: The walls of the right antrum of Highmore were completely necrosed and the antrum filled with worms. The middle turbinate on the right side was markedly necrosed. The right frontal sinus was open, and the right ethmoidal cells exposed. The walls of the antrum on the left side were partly necrosed. The turbinate on this side was partly necrosed and the ethmoidal cells exposed. The right eye was swollen shut and a worm was found in the lacrimal sac. These worms were the ordinary Texas screw-worms measuring about 1 inch in length and about ⅛ inch in diameter. Forty were removed at operation. On the right antrum a Cadwell-Luc operation was performed. On the left antrum a Denker operation was done. The Ballenger turbino-ethmoidectomy was performed on both sides. The right frontal sinus was curetted. The right canaliculus was split and the lacrimal duct probed. All sinuses were packed with iodoform gauze, after a thorough irrigation with a 10 per cent. solution of chloroform.

The after-treatment consisted in blowing iodoform into the nose and sinuses for one week and a vigorous course of antisyphilitic treatment. After a week the man was in a much improved condition and left the hospital.

This patient had a long-standing specific necrosis of the bones of the nose and accessory sinuses which undoubtedly attracted the fly carrying the larvae and furnished favorable conditions for their growth and reproduction.

Oct. 27, 1914, the patient was cured of the worms, and the nose looks perfectly healthy except for the damage done by the specific necrosis previously.

OIDIOMYCOSIS IN PORTO RICO

E. R. HILDRETH, M.D., AND A. C. SUTTON, SAN JUAN, P. R.

While about 150 cases of oidiomycosis have been recorded, we think this is the first case noted in Porto Rico. The diagnosis was made from an examination of fresh specimens of pus in 10 per cent. sodium hydroxid solution, and of stained smears. The pus, which was rather whitish, contained numerous doubly-contoured, oval and spherical bodies, frequently budding, and in the sodium hydroxid solution highly refractive. They varied from 10 to 15 microns in diameter. Besides there were many smaller spherical bodies about 3 microns in diameter.

History.—Mr. D. A., aged 40, a native of San Juan, Porto Rico, who had never been off the island, was first seen in our clinic at the Presbyterian Hospital, San Juan, July 22, 1914. He complained of painful lumps on his legs, and also cough and pain in his chest. Statements regarding any family history were unreliable.

Present Illness.—The first nodule appeared about the middle of May, on the outer part of the left leg, about 4 inches below the knee. About one month later two more appeared, one on the front of each thigh about 3 inches above the knee. Two weeks later two more came out; one on each leg 3 inches above the last ones. They began as small, hard lumps under the skin, and became steadily larger, until about an inch in diameter, when they softened in the center. They were always extremely painful from the start. The patient had had attacks of pain in his chest every two or three months for the past two or three years, accompanied by a cough with a slight amount of tenacious phlegm.

Physical Examination.—The oldest nodule was an inch and a half in diameter. The center showed distinct fluctuation. The outer edge was very hard and the surrounding tissues were somewhat infiltrated. The skin over all of them was a deep purple. The lesion just above the largest one had likewise begun to soften. The others were simply hard, painful, subcutaneous nodules. The inguinal glands on both sides were distinctly palpable. There were no marked physical signs in the chest. There was, however, slight dulness at the left base, accompanied by a louder respiration and more prolonged and higher pitched expiration than at the right base. The sputum was never examined because the expectoration ceased before the second visit.

Treatment.—The nodules which showed fluctuation were incised and drained with iodoform gauze. By the next visit they had become deep, punched-out ulcers, which were then kept on a wet mercuric chlorid dressing. Ichthyol ointment was used to rub on the other nodules. The patient was given potassium iodid internally, 10 drops three times a day, increasing 1 drop each dose to 20 drops of a solution of 50 gm. of potassium iodid in 50 c.c. of water.

The patient showed steady improvement. The symptoms in the chest disappeared. The nodules on the legs became smaller and smaller. All the pain disappeared. When last seen, a month and a half after the first visit, he seemed fully recovered.

New and Nonofficial Remedies

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED BY THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION. THEIR ACCEPTANCE HAS BEEN BASED LARGELY ON EVIDENCE SUPPLIED BY THE MANUFACTURER OR HIS AGENT AND IN PART ON INVESTIGATION MADE BY OR UNDER THE DIRECTION OF THE COUNCIL. CRITICISMS AND CORRECTIONS ARE ASKED FOR TO AID IN THE REVISION OF THE MATTER BEFORE PUBLICATION IN THE BOOK "NEW AND NONOFFICIAL REMEDIES."

THE COUNCIL DESIRES PHYSICIANS TO UNDERSTAND THAT THE ACCEPTANCE OF AN ARTICLE DOES NOT NECESSARILY MEAN A RECOMMENDATION, BUT THAT, SO FAR AS KNOWN, IT COMPLIES WITH THE RULES ADOPTED BY THE COUNCIL.

W. A. PUCKNER, SECRETARY.

RADIUM BROMIDE.—$RaBr_2$.—The anhydrous radium salt of hydrobromic acid.—The market supply is a mixture of radium bromide and barium bromide and is sold on the basis of its radium content.

Actions and Uses.— See Radium.

Dosage.—See Radium.

Radium Bromide, Radium Co. of America.—Radium bromide is supplied in the form of a mixture of radium bromide and barium bromide. It is sold on the basis of its radium content. All deliveries are made subject to the test of the U. S. Bureau of Standards or any reputable university or radium expert whom the buyer may designate at the time of purchase.

Manufactured by the Radium Co. of America, Sellersville, Pa.

Radium Bromide, Standard Chemical Co.—It is supplied in the form of a mixture of radium bromide and barium bromide for use in applicators, inhalatoriums, and injection solutions and is sold on the basis of its radium content.

Manufactured by the Standard Chemical Co., Pittsburgh, Pa. (The Radium Chemical Co., Pittsburgh, Pa.).

Pure anhydrous radium bromide, containing 58.6 per cent. of radium (Ra), is a white or slightly brownish crystalline substance, soluble in water.

The presence of radium can qualitatively be demonstrated by electroscopic or by photographic methods.

The quantitative determination of radium is carried out according to the method of Rutherford and Boltwood (Rutherford's "Radio-Active Substances and their Radiations").

RADIUM CARBONATE. — $RaCO_3$. — The anhydrous radium salt of carbonic acid.— The market supply is usually a mixture of radium carbonate and barium carbonate and is sold on the basis of its radium content.

Actions and Uses.— See Radium.

Dosage.—See Radium.

Non-Proprietary Preparation:

Radium Carbonate, Standard Chemical Co.—It is supplied in the form of a mixture of radium carbonate and barium carbonate for use in applicators. It is sold on the basis of its radium content.

Manufactured by the Standard Chemical Co., Pittsburgh, Pa. (Radium Chemical Co., Pittsburgh, Pa.).

Pure radium carbonate, containing 79.0 per cent. of radium (Ra), is a white or slightly brownish salt insoluble in water, decomposed by acids.

No gases are given off spontaneously from anhydrous radium carbonate by reason of the decomposing action of the radiations, as is the case with the chloride and bromide.

The presence of radium can be demonstrated qualitatively by electroscopic or by photographic methods.

The quantitative determination of radium is carried out according to the method of Rutherford and Boltwood (Rutherford's "Radio-Active Substances and their Radiations").

NON-PROPRIETARY BRANDS OF ACCEPTED ARTICLES

Arbutin, Merck.—Merck and Co., New York.

Radium Chloride, Radium Co. of America.—Radium chloride is supplied in the form of a mixture of radium chloride and barium chloride. It is sold on the basis of its radium content. All deliveries are made subject to the test of the U. S. Bureau of Standards or any reputable university or radium expert whom the buyer may designate at the time of purchase.

Manufactured by the Radium Co. of America, Sellersville, Pa.

Radium Sulphate, Radium Co. of America.—Radium sulphate is supplied in the form of a mixture of radium sulphate and barium sulphate. It is sold on the basis of its radium content. All deliveries are made subject to the test of the U. S. Bureau of Standards or any reputable university or radium expert whom the buyer may designate at the time of purchase.

Manufactured by the Radium Co. of America, Sellersville, Pa.

The following preparation has been accepted for inclusion with the appendix to New and Nonofficial Remedies:

Antiseptic Supply Co., New York.

Cupric Applicators (Copper Sulphate 20-25 per cent.).—Wooden sticks 6½ inches long, tipped with a mixture of copper sulphate, alum and potassium nitrate, containing from 20 to 25 per cent. of copper sulphate, packed in gelatin tubes. Each stick is to be used but once.

Therapeutics

PREVENTION IS GREATER THAN CURE

(Continued from page 2229)

XIII

CARE OF THE TEETH AND MOUTH

The importance of oral cleanliness is becoming more widely recognized. The discovery that individuals, apparently well, may be carriers of pathogenic germs, especially of the bacillus of diphtheria, of the pneumococcus and of the bacillus of influenza, makes persons so infected a menace to their associates. How frequently the pneumococcus causes pneumonia in one who carries this germ accidentally is of course not known. Whether an individual who develops pneumonia always receives an acute infection with this germ, or whether, becoming debilitated by an influenza or a cold caused by some other germs, he has his resisting power so reduced that the pneumococci present in his mouth and throat cause active infection, cannot readily be determined. Streptococci and staphylococci are of frequent occurrence in the mouth, especially when there are decayed teeth, or diseased gums, tonsils, noses or any of the sinuses surrounding these regions. Whether these germs so present in a person's mouth frequently or infrequently infect others need not be considered. It is certain that the carriers of the germs are a constant source of danger to themselves, not only on account of the local disturbance, which may become more or less permanent with more or less disorganization or disintegration of solid tissues, but also from the danger of septic and pyemic infection. From such local infections joint inflammations are frequently caused, whether or not this is the case with true rheumatism, endocardial inflammations, and possibly such serious blood disturbances as pernicious anemia or leukemia. More or less serious glandular disturbances may occur from these local putridities or suppurations and the lungs are in constant danger from infection from these organisms. Some of these bacteria may also cause conditions that allow an infection by tubercle bacilli. Chronic nephritis must also be listed as an occasional consequence of a local infection in the mouth, nose or throat.

More or less constantly these pathogenic germs must be swallowed with food, drink and saliva. Probably most of them are killed by the hydrochloric acid of the gastric juice, provided the stomach is normal. If the stomach secretions are imperfect or if there is a chronic congestion of the mucous membrane of the stomach, many of these germs doubtless pass alive into the intestine and may there be a cause of a chronic enteritis or an infection of the gall-bladder, or they may possibly disturb the pancreas, and may be the cause of an ultimate incurable organic disease or incurable blood disturbance.

The corollary of the foregoing, and the possible and more or less frequent results of mouth infection which have not been overestimated, is cleanliness of the mouth, nose and throat. The teeth and mouth should at least be thoroughly cleansed on rising in the morning and on going to bed at night. A thorough use of the tooth-brush with such tooth-powders or tooth-pastes as seem advisable, depending on the age of the person and the condition of the gums and the character of the deposits that occur on the teeth, should be made daily. Some teeth cleanse readily and do not require a very stiff brush or very harsh treatment. Others need a stiffer brush and a powder, not too soapy, for complete removal of all deposits. If the gums bleed readily, they should be hardened with simple astringent washes, either a dilute alcohol or a dilute astringent tincture such as myrrh, or a tannic acid wash. Potassium chlorate mouth-washes and gargles are very soothing to irritated mucous membranes, but ordinarily any simple alkaline wash or mildly antiseptic solution as borax or boric acid solutions will be found sufficient, with the proper rubbing of the gums with a not too hard tooth-brush, or rubbing the gums with the fingers, that is, massage. The powder selected for cleansing the teeth is generally alkaline, with chalk or magnesia, but it has been shown that acid cleansing preparations, especially the acid fruits, are more efficient in causing the death of bacteria that occur in the mouth.[1] Whatever powder is chosen, it should contain no hard crystals that could possibly injure the enamel of the teeth.

A few children have never been taught to cleanse their teeth at all; many children have never been taught the proper manner of cleansing their teeth. Consequently, it should be the duty of the trained nurses of schools not only to examine the condition of the teeth and mouth of the children, but also to instruct them how to use their tooth-brushes, and what the hygiene of the mouth means. Some physicians urge that there should be daily gargling with some simple mouth-wash or physiologic saline solution, and also urge the snuffing into the nostrils and then expelling of such solutions. Theoretically, cleansing of the nostrils from the dust and bacteria inhaled should be a daily duty. Washing the mouth and throat with some simple solution should also be daily done. Practically, however, it is difficult to enforce such advice. Also, as far as the nostrils are concerned, solutions and sprays may irritate the mucous membrane, or may remove Nature's protective mucus. For this reason it may not be advisable generally to recommend washing of the deeper parts of the nostrils with antiseptic or other solutions.

---

[1] Oral Cleanliness, Therapeutics, The Journal A. M. A., Nov. 8, 1913, p. 1719.

The removal of hopelessly decayed teeth and the filling of the cavities in teeth that can be preserved are essential to health. The trained nurse should discover such teeth in children and strongly advise, if not insist, that they be properly attended to. Alveolar abscesses, or other localized infection, should be treated by the physician or dentist until cured. Temporary frequent washing of all pus parts, unless the cavity is more or less closed, with hydrogen peroxid solutions, the dilution depending on the part affected, is efficient until the diseased part can be more thoroughly treated.

Pyorrhea alveolaris, very frequent in adults, very rare in children (unless the child is generally debilitated, or in children who have rickets) is a germ disease that is cured only by the most persistent and continuous treatment. Cleanliness and antiseptic washings are the means of prevention, but these rarely will cause a cure. Iodin treatment by the dentist will sometimes cure up pockets of infection. In inveterate cases vaccines, especially autogenous vaccines, have many times proved efficient. Sinus diseases are well treated only by nose and throat specialists.

Let it be urged that it is a mistake to retain too long a tooth that is causing disturbance. Many a serious condition and a great deal of jaw, and even antrum trouble has been caused by trying to preserve a tooth that is diseased at its root, or has a pocket of infection running down from the gum toward the root. A tooth that is diseased and cannot be well treated from the surface and which tends to cause serious disturbance of the fifth nerve, and especially if the pain comes in spasms, cannot be too soon removed. Dentists are often too conservative. Roentgenograms of the conditions in a jaw will often show a diseased tooth, or ill-placed teeth, which may be the cause of pain.

A few more suggestions might not be out of place.

First, the tooth-brush should not only be a good one, and not have loose bristles to cause injury or to be retained in the mouth or throat, but the brush should be deposited in an antiseptic solution. Of what value is it to cleanse the germs from the mouth and teeth and then allow them to grow in the tooth-brush to become a source of infection for following days? After using, the tooth-brush should be cleansed and placed in a test-tube or a bottle holder with alcohol or in a weak formaldehyd solution, as 1 part of liquor formaldehydi to 25 parts of water.

Second, the constant and frequent use of hydrogen peroxid solutions, which has become more or less of a fad with many persons, is a mistake. It is not good for the teeth, and not good for the gums, although it is used and should be used in septic or infected conditions, but not then for too long.

Third, the teeth and mouth should receive a great deal of care and attention during all illness, whatever that illness may be.

Fourth, before all operations which are not of the emergency type, the teeth and gums should be put into good condition by the patient's dentist. Before operation in all cases the mouth, teeth and gums should be thoroughly cleansed and cleaned with hydrogen peroxid or other antiseptic solution.

ADENOIDS; HYPERTROPHIED TONSILS; OTORRHEA; CERVICAL ADENITIS

While any one or any two of these conditions may occur without the others, they are all more or less closely associated, and the schoolteacher and the trained nurse should take note if any one of them is present in a child, and the child should then be sent to the medical inspector or medical examiner. The importance of treating hypertrophied and diseased tonsils has already been discussed. The association of mouth and throat diseases with cervical adenitis is well understood. Also the necessity for removing obstructive adenoids which hinder proper breathing and prevent the removal of dust particles and germs and the warming of the air, requires no discussion.

Adenoids not only cause and allow nasal catarrh, recurrent tonsillitis, chronic pharyngitis, and even bronchitis with perhaps, later, the development of cervical adenitis, but they may also be a cause of obstruction of the eustachian tubes and disturbance and infection of the ears. They may allow infection of the sinuses associated with the nostrils, and they may prevent the proper development of the bones of the face, the proper growth of the nose and cause that vacant, open-mouth expression, which is so perfectly characteristic of this simple but frequent condition. It is needless to urge that the earlier obstructive or hypertrophied adenoids are removed, the less likely are complications to occur and the more normal will be the growth of the bones of the face, nose and jaw.

The seriousness of discharging ears will be recognized when Dr. N. P. Stauffer's statements[2] are repeated, that, of 90,000 deaf persons in the United States according to the census of 1900, 51,000 were deaf from childhood, that 75 per cent. of deafness is caused by discharging ears, and that 75 per cent. of discharging ears is due to adenoids and hypertrophied tonsils.

With acute adenitis the child has a high temperature, and it is soon recognized that he is sick. It should be remembered that a child may have folliculitis in the nasopharynx which may give infection to others much the same as follicular tonsillitis. With chronic enlargement of the cervical glands the little patient's temperature and nutrition should be carefully studied. Also, any focus of infection in the throat should be noted.

The best management for the individual patient with an enlarged gland or glands is for the decision of the family physician. Not all enlarged cervical glands are tuberculous; not all enlarged glands should be removed. A suppurating gland, however, should never be neglected. Also, chronically enlarged cervical glands may become infected with tuberculosis, or may be the beginning of more serious glandular trouble, as Hodgkin's disease. In other words, enlarged glands should always be looked on with suspicion, and generally the parents should be advised that the child should not remain in school, but may perhaps attend an open-air or open-window school. The treatment should be decided by the family physician. It should be noted, however, that iodid surely, and arsenic perhaps, will stimulate a tuberculous process to more widespread activity. Whatever is done, it should be emphasized that a child with enlarged glands of the neck is under suspicion of ill health as long as such glands are in evidence.

(To be continued)

THE JOURNAL OF THE
AMERICAN MEDICAL ASSOCIATION

535 North Dearborn Street . . . Chicago, Ill.

Cable Address . . . . "Medic, Chicago"

Subscription price . . . . . Five dollars per annum in advance

Contributors, subscribers and readers will find important informin on the second advertising page following the reading-matter

SATURDAY, DECEMBER 26, 1914

On account of the large amount of space occupied by the Index in this issue of The Journal, certain departments have been omitted entirely and others abbreviated.

THE INDEX

This issue of The Journal contains the index to the current, or sixty-third, volume of The Journal, including the current medical literature which has been listed from week to week. The Index contains references to original articles in over two hundred of the leading medical journals of the world, including those of the principal foreign countries.

The Index consists of two parts — an author and a subject index. Under "Authors" appear the names of all who have contributed articles to The Journal or to any other journal listed in the current literature department, as well as the names of those whose papers are abstracted in the medical society reports in The Journal. Under "Subjects" will be found complete references to all reading-matter in The Journal and references to the original articles in all domestic and foreign journals listed, arranged under the subject of the article with double entry when necessary and with numerous cross-references to facilitate the use of the Index. The figures in bold-faced type refer to reading-matter in The Journal.

The "Guide to Current Medical Literature," under which title the Index appears in pamphlet form,[1] contains, in addition, the titles of the articles listed, arranged chronologically and by journals, as in the Current Medical Literature Department. It is issued in separate form for convenience—to make it unnecessary to handle the bound volume of The Journal.

Just preceding the Index a list of the journals indexed during the past six months is given. Any foreign journal, except those starred, will be lent by The Journal to subscribers and members in the United States with the understanding that it will not be held over three days. Requests for journals should be addressed to the Library of the American Medical Association and six cents in stamps should be enclosed. This covers the average expense of mailing a journal. The addresses of the domestic journals are given, and these can be obtained direct from the publishers. No domestic journal will be lent, as these can be obtained direct from the publishers as easily and as quickly as from us.

PITUITARY EXTRACT AND MILK SECRETION

It cannot be denied that the secretion of milk is subject to nervous influences. Nevertheless physiologists have not yet succeeded either in producing secretion by the method suggested by experience with other secretory structures, namely, by stimulation of nerves going to the mammary glands, or in stopping a secretion in progress by section of such nerves. It is a well-established belief that the secretion and composition of the milk may be affected reflexly through the nervous system, as for example under the influence of the emotions. The action may even be reciprocal, as in the case of the pelvic organs, when the act of suckling excites tonic contractions of the uterus.

Food has some influence on the make-up of the milk; yet this factor is relatively so subordinated to others that in current speech the quality of the milk is regarded as a matter of "breed versus feed." Aside from both of these agencies, the nervous and the dietary, which may act on the mammary gland, one is impelled to ask how the flow is initiated or regulated from time to time in the individual. We approach here the question of the existence of galactagogues.

In 1910 Drs. Ott and Scott[1] of the physiologic laboratory at the Medico-Chirurgical College of Philadelphia found, in the goat, that during the early nursing period an intravenous injection of an extract of the posterior part of the hypophysis rapidly and greatly increased the secretion of milk. The infusion starts the flow in about one minute; it reaches its height (under the conditions of experiment) in four minutes, after which it rapidly falls to normal. As a concrete instance of the extent of this response we may quote one trial in which the flow of milk was 5 drops during five minutes before introduction of 5 drops of a pituitary extract by vein, and 405 drops in the same time thereafter. Extracts of other glands of internal secretion—corpus luteum, pineal body and thymus—may increase the milk flow fourfold in five minutes, whereas the pituitary product is by all means the most powerful galactagogue, increasing it a hundredfold or more. The ovary minus the corpus luteum has no effect whatever.

Soon after these observations were confirmed by Schäfer and Mackenzie[2] on other species of lactating animals. They found that the extract of the anterior lobe of the pituitary was inactive. Later Mackenzie[3] observed that the galactagogue substance is present in the pituitary body not only of lactating females, but also of non-lactating females and of males.

---

[2] Schäfer, E. A., and Mackenzie: Proc. Roy. Soc. (B), 1911, lxxxiv, 16.

It need scarcely be remarked that such observations promptly suggested the application of the findings to cows and to lactating women. In the case of cattle the total effect of administration of pituitary extract on the total daily yield of milk has been negative.[4] The reason for this is made probable by studies of Hill and Simpson[5] at Cornell University. They observed, it is true, that the intravenous injection of pituitary extract (whole gland or posterior lobe alone) leads to an immediate secretion of milk very rich in fat. The effect, however, quickly passes off. There is a corresponding diminution in the yield of milk at the next milking period, and to some extent in the percentage of fat, so that in the twenty-four hours there is practically no increase in the total quantity of milk or of fat obtained.

Schäfer, in 1912, observed slight transitory effects from introduction of pituitary extract in a human subject. The most significant observation, however, is one recently reported by Hill and Simpson[6] in a healthy young married woman nursing her second baby, in the fifth month of lactation. Intramuscular injection of a commercial preparation equivalent to 20 mg. of the dried infundibular portion of the gland was followed, in ten minutes, by a marked increase in the amount of milk secreted. After a latent period of from twenty to thirty seconds the mother could feel the milk "coming into the breasts," and a few minutes later abdominal pains were experienced, presumably due to increased intestinal peristalsis. The milk withdrawn after injection was rich in fat, the average figure for the three experiments being 5.5 per cent. as compared with 3.4 per cent. for three days when no pituitary extract was administered. In the milk yielded twenty-four hours after injection the fat content was still somewhat above the normal. Although no quantitative estimations were made, judging from the mother's experience in nursing the child, it would appear that the quantity of milk obtainable by it on the morning after the injection was diminished.

The import of these observations must not be exaggerated. They afford no evidence of any increased production of milk. But the demonstration of a chemical influence manifested by altering the rate of secretory discharge is of itself an interesting accomplishment quite aside from any further immediate application thereof.

THE SUPRARENAL BODIES AND KIDNEY FUNCTION

Although the nature of the supply of vasomotor nerves to the kidney and the conditions which bring them into activity are fairly well known, additional factors which may control the flow of urine are far from being completely elucidated. Most writers on the physiology of the kidneys deny the existence of specific secretory nerves for these organs, although Asher and Pearce have suggested that the vagus and splanchnics are direct secretory nerves to them. There is a tendency in some quarters to postulate the occurrence of specific chemical excitants or diuretics, formed in the body and acting as do the group of stimulants now classed as hormones.

Experimenters who have busied themselves with the physiology of the renal secretion have at times been brought face to face with contradictions which they could not explain on a purely vasomotor basis, that is, by corresponding alterations in the blood-supply. In the course of an investigation in this field Cow[1] was struck by the different effects produced by perfusing the kidneys directly through the renal arteries and through the aorta. After the exclusion of possible sources of difference in the condition of the experiments, the only feasible explanation appeared to be that in the perfusions through the aorta the fluid in some way passed through the suprarenal glands before reaching the kidneys. A further examination of the anatomic possibilities showed that there exists, at any rate, a possible channel through which the products of the suprarenal bodies can reach the kidneys directly and without either dilution or oxidation in the general circulation.

There is nothing essentially unique in the demonstration of a direct vascular connection between the medullary portions of the suprarenal bodies and the kidneys. It has long been known that vessels in the neighborhood of the kidneys anastomose with vessels connected with adjacent parts. Such anatomic interrelations have been described between the vessels of the kidney, suprarenal and large intestine.[2] As the result of Cow's work it now appears that under certain conditions epinephrin in appreciable amount is poured directly into the kidneys from the suprarenal bodies and consequently produces a diminution in the flow of urine. This effect is precisely what takes place on stimulation of the splanchnic nerves which, in turn, are known to be the path by which fright or excitation of afferent nerves causes a reflex exhaustion of the epinephrin content of the suprarenal bodies.

In the light of this newer knowledge it may be possible to explain the findings of Asher and Pearce[3] without introducing the hypothesis that the kidney has a direct secretory innervation. According to Cow we may assume that the stimulation of the splanchnics (as conducted by Asher and Pearce) produces an outflow of epinephrin from the suprarenal bodies and that some, at any rate, of this finds its way directly to the kidney, producing a diminution in the flow of urine. The novelty of this contribution consists in the implication that the suprarenal bodies may be regarded as direct regulators of urinary activity.

BACTERIOLOGIC STANDARDS FOR DRINKING WATER

About two years ago a commission was appointed by the Secretary of the Treasury following recommendations made by the United States Public Health Service to investigate the quality of drinking water furnished to travelers by common carriers. Affecting as it does all who travel, the question is one of practical importance to public health authorities. The commission was asked specifically to recommend standards of purity for drinking water supplied to the public by public carriers in interstate commerce. After devoting more than a year to a consideration and discussion of the problem, the commission has not yet arrived at a satisfactory consensus of opinion on a number of minor questions. In the meantime, however, the importance of establishing certain limiting requirements, and the fact that the commission is of one opinion on the essential points of such requirements, have made it seem desirable to incorporate its findings thus far in a progress report.[1] Recommendations contained in this report have been embodied in Interstate Quarantine Regulations in accordance with a letter of promulgation issued by the Secretary of the Treasury under date of Oct. 21, 1914. In the future common carriers will be required to furnish water for passengers in interstate traffic which will comply with the following criteria:

1. Water supplies conforming to the prescribed requirements shall be free from injurious effects on the human body and free from offensiveness to the sense of sight, taste or smell.
2. Supplies of the quality required shall be obtainable by common carriers without prohibitive expense.
3. The examinations necessary to determine whether or not a given water-supply meets the requirements shall be as few and as simple as consistent with the end in view.

The commission's report is specific in pointing out that "the recommendations here presented are limits of permissible impurity and in no sense standards of purity." They are recommended "not as the nearest approximation to purity which it is desirable to attain, but, on the contrary, as the farthest deviations from purity considered permissible in the water-supplies with which this report deals." It is also emphasized that these limits are only for application to the special case in question.

Because of the difficulty in correlating what might be regarded as objectionable physical and chemical properties of water with definite effects on the health of the user, and because of the minor sanitary importance at most of regulating this class of impurities, these questions have been left for further discussion, and the present report deals only with the more important matter of bacteriologic standards. It is furthermore recognized by the commission that strict specifications for a water which shall at all times be undoubtedly safe are justified by reason of the comparatively small quantities of water used by common carriers and the ready availability of methods of purification which permit the furnishing of a water of high bacteriologic purity without imposing an undue burden on common carriers.

The standards proposed, and which have been incorporated in the Interstate Quarantine Regulations, are briefly the following:

1. The total number of bacteria developing on standard agar plates after twenty-four hours' incubation at 37 C. (98.6 F.) shall not exceed 100 per cubic centimeter. The estimate shall be made from not less than two plates showing such numbers and distribution of colonies as to indicate that it is reliable and accurate.
2. Not more than one out of five 10 c.c. portions of any sample examined shall show the presence of organisms of the *Bacillus coli* group when tested by a specified procedure.

The formation of 5 per cent. of gas in lactose peptone broth incubated for forty-eight hours at 37 C. in the original sample, the development of acid-forming colonies on lactose litmus agar plates or of bright red colonies on Endo's medium plates prepared from the fermenting tube, and the subsequent formation of gas occupying 10 per cent. or more of the closed arm in lactose peptone broth inoculated with typical colonies from either of the foregoing plates, constitute the criteria for the presence of organisms of the *Bacillus coli* group which shall be used in interpreting the second specification.

It is further recommended that one portion of 1 c.c. and one portion of 0.1 c.c. of the sample be plated in lactose peptone broth in order to demonstrate more fully the extent of pollution in grossly polluted samples and that the culture mediums and methods used shall be in accordance with the specifications of the Committee on Standard Methods of Water Analysis of the American Public Health Association, as set forth in "Standard Methods of Water Analysis, A. P. H. A., 1912."

---

[1] Pub. Health Rep., Nov. 6, 1914.

The reasonable character of these regulations, the feasibility of compliance on the part of the common carriers without undue expense, the degree of protection that such compliance will afford to travelers and the relative simplicity of the routine tests that are recommended are sufficient evidence of the serious thought which has been given to this important matter by the members of the commission, to whom much credit is due for this satisfactory outcome of their labors.

THE SIGNIFICANCE OF STARCH-DIGESTING ENZYME IN THE URINE

In the evolution of clinical diagnosis in recent years the attempts to find suitable chemical indications of functional disorders have been decidedly conspicuous. Now and then some test, like that involving the altered excretion of phenolsulphonephthalein by the kidneys in conditions of health or disease of these organs, finds a permanent application in practical medicine. The majority of the proposed procedures, on the other hand, represent a momentary enthusiasm on the part of some investigator. He elucidates his method with a few clinical illustrations that seem to demonstrate its utility. Presently the new test is subjected to a rigorous experimental critique and is found to be devoid of the fundamental requisite of a good test, namely, its limitation to well-defined conditions and its applicability to a restricted number of phenomena. Any reaction which fails to possess this feature of being characteristic, that is, of being exemplified by few substances at most or under a few conditions at best, loses its claim to be rated as a "test."

The urine has furnished the basis for almost innumerable attempts to devise functional tests based on chemical reactions. In some cases, as in the detection of glycosuria and albuminuria, the appearance of constituents normally absent from the urine has afforded the diagnostic reaction. In other instances, as in the study of acidosis or other metabolic disturbances, the clinical chemist has learned to ascertain the deviations of normally present urinary components like ammonia and uric acid, from their usual and readily explicable concentration. The ideal aim is to find some easily detectable or determinable substance of which the origin or physiologic history is definite. Too often the variables in the problem are so manifold that the practical solution fails.

The study of the attempts to employ the estimation of the amylolytic power of the urine as a functional test in clinical medicine well illustrates the necessity of learning the underlying facts before the use of a reaction of this sort is advised. A starch-digesting enzyme is commonly present in the urine. It is not difficult to obtain some conception of the concentration of the amylase. The latter is found, within the organism, in digestive glands and their secretions, in the blood and secretion of the kidneys. Diminution of the amylase in the urine has been described as evidence of impermeability of the kidneys. Obviously it is equally logical to conceive a lowered output of the enzyme to be due to diminished production at the various sources from which it is normally derived prior to its renal excretion; or even to an increased destruction of circulating amylase by some physiologic or pathologic agency. And accordingly one finds the urinary output of amylase related by the diagnosticians to altered pancreatic function (leading to an altered return of pancreatic amylase to the blood and thus to the urine). Indeed, from a still different point of view it has even been taken as an index of altered absorption of amylases from the digestive tract and hence as evidence of abnormal gastro-intestinal conditions.

It is not surprising, as King[1] remarks in connection with his elaborate investigation of the blood and urinary amylase conducted at the Hull Laboratory of Physiology of the University of Chicago, that amylase elimination has not been adopted more generally as a diagnostic measure either with a view to testing the functional capacity of the kidney or in order to diagnose pancreatic lesions. The physiologic conditions governing the elimination of the enzyme, as well as its actual source, have not been known definitely enough. The immediate source of the urinary amylase is the amylase present in the blood. King's experiments, as well as those of earlier investigators, show that the variations in the amount of amylase in the urine, independent of the amount in the blood, may depend on the permeability of the kidney, the condition of the renal epithelium, and on the normal physiologic variation in renal activity. It is possible that amylase may act as a stimulus resulting in its own elimination just as does urea or dextrose.

If the amount of amylase in the urine depends not only on the functional capacity of the kidneys, but likewise on the amount finding its way into the blood, how about the source of the latter? There is evidence that the salivary amylase may appear in the urine; for those animals which secrete ptyalin eliminate in the urine more amylase per kilogram of body-weight than those which do not secrete a starch-splitting enzyme into the mouth. Removal of the pancreas results in a decrease in urinary amylase, thereby suggesting that the pancreas is a direct source of amylase. Trauma of the pancreas and lesions causing obstruction to the natural outflow of the pancreatic juice lead to an increase of amylase in the urine, pointing to a direct passage of the enzyme from the gland tissue into the blood. The blood can, therefore, probably receive amylase by at least two paths, namely, directly from the glands and indirectly from the digestive tract. There are unquestionably sources of amylase other than the salivary and pancreatic glands; for even after removal of both of these there is not a complete disappearance of the urinary starch-digesting enzyme. The kidney itself may be a source; the liver, muscles, spleen and leukocytes all contain amylase and may serve as sources. Thus the increase of amylase in the blood and urine of animals dying of acute infections may be due to the greater destruction of the leukocytes accompanying the leukocytosis.

---

[1] King, C. E.: Studies on Blood and Urinary Amylase, Am. Jour. Physiol., 1914, xxxv, 301.

King's investigations show further not only that amylases enter the blood directly from the tissues, but also that when once in the blood the enzyme is destroyed much more slowly than is the case during its passage through the intestinal mucosa. Feeding experiments with amylase indicate that only in case the digestive tract is flooded with the enzyme does enough pass into the blood to bring about a significant increase in the urine. Aside from variations in the excretory factor, therefore, there are indications that fluctuations in the amylolytic power of the urine may be due to increased or decreased production of amylase within the body, to an obstruction to the normal outflow from the pancreas or salivary glands, to injury of the pancreas, to decreased absorption from the intestinal lumen, to the liberation of glycogenolytic enzyme, and possibly to leukocytosis. We can well agree with King's conclusion that quantitative estimations of urinary amylase alone would have but little significance as a diagnostic point. Perhaps a long series of tests coupled with an accurate history may serve as a useful supplement in the diagnosis of renal, pancreatic and obstructive lesions.

Current Comment

FLAVORS AND VITAMINS

The term "vitamin" was first applied by Funk[1] to a substance isolated from rice and occurring only in the outer portion of the grain, which is removed in polishing rice. The fact that beriberi is caused by an exclusive diet of polished rice, but may be prevented by the addition of this vitamin to such a diet, leads to the conclusion that that disease is due to the absence of this substance from the diet. Other substances have been classed as vitamins, not because of proved chemical relationship to the vitamin of beriberi, but because their presence seems to be necessary to prevent other diseases from developing. Thus Funk believes we have a vitamin of beriberi, one of scorbutus, of pellagra, etc. The discovery of the vitamins has emphasized the value of those elements of the food, which, although present in minute amounts, exercise a determining influence in the utilization of the ordinary articles of diet. The significance of this new knowledge is emphasized by Garrod[2] in his address before the British Medical Association at its recent meeting. As Garrod says, "the immense practical importance of these hitherto unknown factors is in the fact that once the missing element—the vitamine—is discovered, a specific remedy for the disease has been found." That the nutritive value of a diet does not depend wholly on its calorific value must be admitted. The importance of flavors, spices, and of the preparation of food so as to arouse the esthetic senses — in other words, the nutritive value of good cooking — has been pointed out by Sternberg[3] of Berlin, who insists that the science of cookery is not merely the application of chemistry and physics, but rather an application of the physiology of the senses, applied psychology and esthetics. The spices and flavors used by the cook, Sternberg suggests, may be closely allied to the vitamins if not identical with them. They may stand in the same relation to loss of appetite and health in general, that the specific vitamins do to particular diseases. As loss of appetite is frequently the forerunner of deficiency of nutrition, it is possible that special flavors and spices may be required for special cases and that the search for these may reward the investigator with a clearer idea of how to meet many of the indefinite ailments that elude our most precise means of diagnosis. In this connection it is worth while to note the action of harmless microorganisms in producing flavors, possibly containing vitamins. The work of Evans, Hastings, Flint and Hart[4] showed that the development of the characteristic flavor of Cheddar cheese depended on a symbiosis of organisms of various groups impossible to secure from pasteurized milk. With the use of various starters the flavor could be varied, but the process of heating the milk destroyed, in some way, the delicate interrelations of bacteria on which the characteristic flavor of the product prepared from raw milk depends. Such researches suggest unlimited possibilities in a branch of pathology which has hitherto received scant attention.

THE URINARY CREATININ OUTPUT OF NORMAL WOMEN

In establishing so-called normal values for various bodily functions and likewise in relation to the chemical composition of body fluids and secretions it has been common in the past, for reasons alike of custom and of convenience, to obtain the data from healthy men. In many instances there is no obvious or inherent reason why the facts thus elicited should differ from those which might be furnished by determinations made on the other sex. For example, one would scarcely expect the composition of the circulating fluid in woman to vary essentially from that which pertains in man. The conspicuous difference in the muscular development of most women in contrast with the usual male type suggests the possibility that any factors involving incidents of muscular metabolism might show quantitative variations, particularly in their absolute amounts in the two sexes. That this possibility may be realized is borne out by data which have lately been submitted from the department of chemistry at the Woman's Medical College of Pennsylvania in Philadelphia.[1] Shaffer[2] considers the urinary creatinin an index of muscular catabolism and believes that sex *per se* has no influence on the excretion of this substance. The creatinin coefficient of woman will therefore be comparable to that of man provided that the muscular efficiency and the amount of adipose tissue is the same. In view of this it is interesting to note that the creatinin excretion of a group of women medical students, who might properly be considered as normal individuals, and who were on a strict creatinin-free and creatin-free diet for two days or longer, ranged from 10 to 25 mg. per kilogram of body-weight. A still more recent report of the composition of the urine of a group of women nurses in the Wesley Memorial Hospital, associated with the Northwestern University Medical School in Chicago,[3] makes it evident that the subjects studied exhibit a low creatinin excretion in comparison with the usual values found for men. There is no peculiarity in the distribution of other nitrogen factors, and no reason is apparent why there should be. Quite possibly, as has been suggested, in the case of creatinin, the fact of lower muscular development and perhaps of lower muscular tone will account for the observed findings. Shaffer has found that what he calls the creatinin coefficient, that is, milligrams of creatinin nitrogen per kilogram of body-weight, ranges from 8 to 11 for normal men. In the case of the twenty-six women referred to[1] the comparable coefficient was below 8 in all but two cases. The latter exhibited unusual muscular development and were accustomed to vigorous gymnastic work. It is probable, from the large series of data on the female sex thus made available, that individual women who through training have maintained a good muscular tone may excrete creatinin in amounts comparable with men. The fact that the average woman tends to confine herself to sedentary occupations and neglect physical exercise, so that her muscular efficiency is reduced in comparison with that of men of the same stature, will doubtless explain the relatively low output of creatinin of females.

THE LESSONS OF A UNIQUE CASE OF DIABETIC ACIDOSIS

An intelligent mastery of many of the problems that arise in the practice of medicine calls for an accurate appreciation of quantitative factors. The ophthalmologist who is making adjustments of a delicate nature depends on careful measurements of certain functions of vision and parts of the eye for guidance in his procedure. Every therapeutist who administers drugs ought to have more than a superficial knowledge of their dosage. Even in matters of diet the importance of a knowledge of the fuel value of foods has begun to be recognized. It is surprising at times to note the errors which creep into applied medicine owing to ignorance of standards: in other words, to a lack of acquaintance with the quantitative features of the subject. A patient is given a quart of milk a day—scarcely 800 calories of food—and is expected to be maintained on it. Infinitesimal doses of active agents are expected to initiate heroic changes. A characteristic case is frequently shown in the treatment of acidosis in which the administration of alkali is indicated, but the quantities prescribed, though large in comparison with customary or even large doses of alkaloids or iodids or salicylates, are nevertheless sometimes almost insignificant in their relation to the acidity to be neutralized or corrected. In diabetic acidosis the quantity of the pathologically occurring acids in the urine often reaches from 15 to 20 gm. a day. It has been known to reach 150 gm., in which beta-oxybutyric acid predominates over its companion diacetic acid. These colossal amounts call for enormous quantities of alkali carbonate for their neutralization. Czapski[1] has recently described what is, as far as we are aware, one of the most extreme cases of profound acidosis ever recorded. The patient, a youth aged 16, passed through two severe periods of intense acidosis with threatening coma, at the Krankenhaus am Friedrichshain in Berlin. During the first of these, in which the beta-oxybutyric acid approached 90 gm. on each of four days, an untoward outcome was averted by intravenous injection of 100 gm. and more of sodium bicarbonate per day. In a second period, ending in death, the output of beta-oxybutyric acid and aceto-acetic acid together reached 143 gm. as a daily maximum, and persisted at about 100 gm. or more during nine days. The total output of these acids in ten days prior to the fatal outcome was more than a kilogram (1,085 gm.). More than 900 gm. of sodium bicarbonate were administered during this period without producing even a neutral reaction in the urine. These are unique data, the reliability of which is attested by the fact that they were collected in the clinic of an expert in this field of medicine, Magnus-Levy. Previous recorded cases involving an excretion of more than 100 gm. of these organic acids per day have shown a persistence of three days at best before either marked improvement or death ensued. There can be little doubt, from other facts furnished in the chemical report of Czapski, that the acids existed in part actually free in the urine; that is, there was a large deficit of bases to serve in the neutralization equilibrium. It is obvious that under such circumstances heroic doses of alkali carbonate and every available channel of introduction — by mouth, intravenously or subcutaneously — are called for. Grains of bicarbonate must be replaced by drams.

NEWS OF THE WAR

In the index in this number of The Journal an increase may be noted in the number of headings devoted to war subjects. The words "war," "army," "wounded" and "wounds" are followed by numerous references occupying from three to ten times the amount of space devoted to them in previous indexes. In this issue of The Journal also appears a letter from Sir William Osler[1] which, as he states, should interest his friends both in the United States and Canada — and does this not embrace the whole profession? The views which he expresses concerning the surgical and the sanitary aspects of the war are of the highest scientific value.

Medical News

(Physicians will confer a favor by sending for this department items of news of more or less general interest; such as relate to society activities, new hospitals, education, public health, etc.)

ILLINOIS

Chicago

Personal.—Dr. Frank A. Stahl has returned after five months abroad.——Dr. George W. Mahoney was elected vice-commander and Dr. Frank P. St. Clair, surgeon, of the Veteran Corps of the Seventh Infantry, Ill., N. G., at its third annual meeting, December 19.

To Boil Water.—Health Commissioner George B. Young, on December 17, sent a warning to all persons living within the district bounded by Chicago, Belmont and Western Avenues and Lake Michigan, to boil all drinking water until further notice, on account of typhoid infection having been found in the wells of the Chicago Avenue pumping station.

INDIANA

Academy of Medicine Incorporated.—The Academy of Medicine of Logansport has been incorporated under the laws of the state, without capital stock. The directors are Drs. Rodney E. Troutman, Charles H. McCully, Henry B. Hill and others.

Personal.—Dr. George W. Brown has resigned as health officer of Frankfort on the ground of inadequate compensation.——Dr. Fred M. Towles, Indianapolis, fell on the pavement, December 2, and suffered a compound fracture of the right leg.——Dr. Thomas Ray Morrison, Churubusco, is seriously ill at Lynn, Fla., as the result of a cerebral hemorrhage.

IOWA

Small-Pox Rather than Vaccination.—In a family at Davenport a case of small-pox occurred in a son, who was removed to the isolation hospital. Vaccination of the other members of the family was advised by the health authorities. This was refused. A week later the family was placed in strict quarantine because five other members of the family developed pronounced cases of the disease.

Personal.—Dr. M. Charles Mackin has been appointed first assistant superintendent of the Clarinda State Hospital, succeeding Dr. George Donohoe, Knoxville, promoted to superintendent of the Cherokee State Hospital, succeeding Dr. Mathew N. Voldeng promoted to superintendent of the new State Epileptic Colony, Woodward.——Dr. Arthur C. Echternacht has resigned as health officer of Mason City.

Foot-and-Mouth Disease Interferes with Agricultural Courses at State College.—On account of the presence of foot-and-mouth disease in some sections of the state and the great danger of spreading it further through public meetings of farmers, Iowa State College has decided not to hold its usual short course for farmers at Ames, December 28 to January 2, this winter. Dates for extension department courses in counties now under quarantine are also to be canceled.

KENTUCKY

Epizootic Among Rabbits.—The state fish and game commission has appealed to the State Board of Health to investigate the cause of the death of many rabbits in Carlisle County. [It will be remembered that a similar outbreak has been reported from Indiana.]

Memorial Operating Room Opened.—A new operating room in memory of his father, the late Dr. Charles A. Long, was presented to the Masonic Widows' and Orphans' Home, Louisville, recently by Charles R. Long. The gift was accepted by the president of the board of directors and Dr. Ap Morgan Vance, president of the medical board of the institution.

Personal.—Dr. Joseph F. Cook, Louisville, while crossing the street, was struck by an automobile recently, suffering injuries of the head and body.——Dr. Virgil F. Barker, Newport, has returned from abroad.——Dr. William E. Gary, chief milk inspector of Louisville, was attacked and beaten by two men at his house in Avoca.——Dr. Anderson D. Park, Rockport, has been elected president of the Rockport Deposit Bank.——Dr. Charles A. Nevitt, Lexington, has returned home after an operation for appendicitis.

LOUISIANA

Personal.—Dr. Randell Hunt, Shreveport, has been elected president; Dr. H. W. Schofield, vice-president, and Dr. Louis Abramson a director of the Caddo Parish School Board.

Pesthouse Should Be Burned.—Dr. Oscar Dowling, Shreveport, president of the State Board of Health, after a personal investigation of the New Orleans Small Pox Hospital, reports that the building is unfit for human habitation and should be burned.——The city is making arrangements for the construction of an isolation hospital.

Improvements of Leprosarium.—A contract has been let for $39,560 to improve the State Leper Home at Indian Village, Iberville Parish. Under this contract the home will acquire two large new cottages, a clinical building, a powerhouse, electric light, cold storage, and a refrigerator plant and the system of sewerage, drainage and plumbing.

Rucker Testifies on Rat Proofing.—At the hearing of the case instituted to test the validity of the rat proofing ordinance of New Orleans, Assistant Surgeon-General William C. Rucker, U. S. P. H. S., gave a review of the work done by his department and detailed the state and city activities which resulted in the eradication of bubonic plague from New Orleans.

Fraternity Chapter Installed.—On December 10 the Alpha of Louisiana chapter of the Alpha Omega Alpha Medical Scholarship Society was installed at the medical department of Tulane University, New Orleans.

MINNESOTA

Follow-Up Society Organized.—The Association of Patients and Ex-Patients of the Minnesota State Sanatorium for Consumptives has recently been organized. Its purpose is to follow up all patients discharged from the sanatorium, find suitable work for the people who are recovering their health, and secure health legislation to advance the interests of the convalescents. Only persons who have been patients at the State Sanatorium, Walker, for three months or more, are eligible for membership. Dr. George William Beach, superintendent of the sanatorium, is chairman of the association and its official organ is the *Pine Knot*.

MISSOURI

Personal.—Dr. William H. Hays, Hannibal, was accidently shot in the right leg while on a hunting trip, December 3, and is under treatment at the Levering Hospital.

Club Organized.—The Physicians and Surgeons Club of Springfield was organized December 1, with an initial membership of thirty-eight. Dr. Frank B. Fuson was elected president; Dr. Joseph W. Love, vice-president, and Dr. Murray C. Stone, secretary-treasurer.

State Board of Health.—The State Board of Health held an examination at St. Louis for applicants for license to practice, December 14, 15 and 16.——The board has begun the free distribution of prophylactic typhoid vaccine manufactured at the state university under the supervision of Dr. Mazyck P. Ravenel.——The board is giving free antirabic treatment to persons bitten by animals. The serum is supplied by the United States Public Health Service and administered under the direction of the state bacteriologist at Jefferson City.

---

[1] Correspondence, Medical Notes on England at War. Sir William Osler, The Journal, this issue, p. 2303.

St. Louis

Memorial Meeting. — Washington University Medical School held a memorial meeting for Dr. Washington E. Fischel, a recently deceased member of the faculty. Dr. Abraham Jacobi of New York was one of the principal speakers.

Free Antitoxin.—As the result of a report of thirty new cases of diphtheria on December 2, Dr. Max C. Starkloff, health commissioner, has obtained from the comptroller an appropriation of $1,000 for the purchase of antitoxin to be used for the poor.

Visit of Dr. Vaughan.—Dr. Victor C. Vaughan, Ann Arbor, Mich., President of the American Medical Association, was the guest of the St. Louis Medical Society at its meeting on December 12, and addressed the members on "Professional Ideals." Dr. Abraham Jacobi of New York also delivered a short address.

Children's Hospital Opened.—The St. Louis Children's Hospital was thrown open for the reception of patients on December 3. On December 12, 13 and 14 the buildings were inspected by the physicians of the city. The hospital is connected with Washington University Medical Department and the Barnes Hospital.

University Dispensary Opened.—The new dispensary of the Medical School of Washington University was opened December 14. This institution has facilities for the treatment of 150,000 patients a year. The clinics of Washington University on Jefferson Avenue, O'Fallon Dispensary on Locust Street and St. Louis Children's Hospital, were closed December 12, and the patients formerly treated are now being sent to the new dispensary which occupies two floors of one of the new university buildings on Euclid Avenue. One of the special activities of the new dispensary will be the social service department which will have in its charge the investigation of the home conditions which produce disease, and devise plans for correcting them.

NEW YORK

Free Wassermann Test.—Dr. Frederick W. Sears, health officer of Syracuse, announced on December 9, that henceforth the Wassermann test will be given free of charge to any person in the city who desires it.

Sanatorium Proposition Defeated.—By a vote of sixteen to eleven, the Otsego County Board of Supervisors, on December 11, defeated the proposition to put the question of the erection of a county tuberculosis sanatorium to a vote at the general election next fall.

New Tuberculosis Hospital.—A special committee of the Board of Supervisors of Cattaraugus County, appointed to establish a county tuberculosis sanatorium, met in Olean December 10, and signed the final papers which gave the county title to land in Rock City as a site for the institution, the construction of which will begin in the early spring. The building will accommodate from 36 to 40 patients.

Message to Health Officers.—The current issue of *Monthly Bulletin of the New York State Department of Health* contains a message to the health officers of New York state from Dr. Montgomery E. Leary, Rochester, president-elect of the New York State Sanitary Officers Association, in which he outlines a plan for still further increasing the usefulness of the association in the promotion of public health. This plan includes the establishment of branches of the association in every county, and of auxiliary organizations among the laity.

New York City

Personal.—Dr. Alvah H. Doty has been appointed consulting expert on communicable diseases in the State Department of Health. Dr. Theobald Smith has been appointed consultant in animal pathology.

PENNSYLVANIA

Will Establish Private Hospital.—The Southern Schuylkill County Medical Society has decided to establish a large private hospital at Schuylkill Haven.

Personal. — Dr. B. F. Haagen, Altoona, was seriously injured in the spine and left arm by the overturning of his automobile in Collinsville, December 7.——Dr. J. Clyde Enos, Charleroi, sustained a fracture of the skull and injuries to the spine in a collision between his automobile and a street car.——Dr. Johnston McLanahan, Chambersburg, is reported to be seriously ill with heart disease.

Philadelphia

Personal.—Drs. Charles Snowden Pancoast and E. Kilbourn Tullidge, sailed December 8 for Genoa, Italy, on their way to Vienna where they will serve as volunteers in the military hospitals.

Fair for War Relief.—At the Made-in-America fete held in Horticultural Hall, December 14 to 16, the proceeds of the doctors' booth were devoted to the sending of surgeons and medical supplies for the relief of those in the war zone, and the proceeds of the American Ambulance Ball, December 15, were utilized for the establishment of beds in the newly planned Philadelphia ward of the American Ambulance, Paris.

TEXAS

Personal.—Dr. E. D. Fyke, Fort Worth, has been appointed state health officer.——Dr. Irvy L. McGlasson, for four years state quarantine officer at Galveston, will relinquish his office and return to Waco to practice February 1.——Dr. Morris H. Boerner, Austin, has resigned as assistant state health officer, to take effect January 15.

Free Diphtheria Antitoxin for the Poor.—Diphtheria is said to be prevalent throughout the state of Texas, though in a mild form. Arrangements have therefore been made through the State Board of Health with local health officers, whereby those unable to pay for it may obtain diphtheria antitoxin free in the larger cities of the state and at very low prices in other portions of the state.

State Board Appointments.—The governor has made the following appointments of the State Board of Health: Drs. Lawrence W. Hollis, Abilene; Carl W. Hoeflich, Houston; Louis M. Weinfield, San Antonio; Hugh L. McLaurin, Dallas; William D. Littler, Fort Worth; Harmon J. Childress, Gilmer, and E. M. Wood, Georgetown.——State Board of Medical Examiners: Drs. J. J. Williams, Groesbeck; John H. McLean, Fort Worth; Arthur M. McElhannon, Sherman; John S. McCelvey, Temple; William B. Collins, Lovelady; H. B. Mason, Temple; L. S. Scothorn, Dallas; Horace C. Morrow, Austin; Thomas J. Crowe, Dallas; Marion A. Cooper, Childress, and F. M. Butencourt, Falls County.——Quarantine Officers: Drs. Duke H. Huffaker, El Paso; S. E. McCain, Brownsville, Marquis D. L. Jordan, Velasco; Everette O. Arnold, Corpus Christi; Justus S. Davidson, San Felipe, and H. C. Hall, Laredo; and Registrar of Vital Statistics: Dr. William A. Davis, Jr., Jourdanton.

WISCONSIN

Personal.—Dr. Ray R. Harris, formerly in charge of the Old Sanatorium, Prairie du Chien, has moved to Dubuque. ——Dr. George Clyde Stimpson, White Creek, has been appointed an intern in the Elgin State Hospital.——Dr. George Wallace Nott, Racine, fractured his right wrist while cranking his automobile, December 8.

CANADA

Faculty Offers Base Hospital Personnel.—The faculty of McGill University has offered the personnel for a mammoth base hospital for foreign service. The British war office has accepted this offer and the personnel and equipment will leave for England in March.

Personals.—The following medical men from Hamilton, Ont., will go with Canada's second war contingent: Drs. Geo. D. Farmer, Ancaster, Ont.; Daniel P. Kappele, William L. Silcox, William F. Nicholson.——Dr. John B. Leathes left Toronto December 13 for England, where he will take up his new duties in the University of Sheffield.——Dr. William E. Struthers, chief medical inspector of schools in Toronto, has resigned and has been appointed chief medical officer of the Workman's Compensation Board of Ontario. ——Dr. Fernand L. de Verteuil, Vancouver, B. C., was the medical officer of the *Good Hope*, recently sunk off the Chilean coast.——Dr. Francis J. Folinsbee, Edmonton, Alberta, has been appointed resident house physician to the Great Ormond Street Hospital for Sick Children, London, England.——Dr. Robert Mayrand, Quebec, is on active service in the war zone as surgeon of Base Hospital No. 1. ——Recently a bust of the late Dr. Emily Stowe was presented to the city of Toronto by a number of her friends. Dr. Stowe was the first woman physician to practice medicine in Ontario.

GENERAL

Church Medical Laboratory.—The medical laboratory authorized by the Missouri Conference of the Methodist Church, South, is to be named the Missouri Valley Foundation for the Conservation of Health. Dr. Daniel Morton, St. Joseph, is secretary of the board and Dr. William H. Minton, St. Joseph, a member of the foundation.

Bequests and Donations.—The following bequests and donations have recently been announced:

Boehme Tuberculosis Camp, Evansville, Ind., $1,000 by the will of Mrs. May Stockwell.

Jackson County, Mich., Antituberculosis Society, residence on West Washington Street, Jackson, to be held in trust after the death of his daughter, Mrs. Julia A. Mersereau, by the will of R. Bruce Coltrin.

Methodist Hospital, Philadelphia, $3,000 by the will of Elizabeth Brines.

A worthy Hospital in Philadelphia, $5,000 to endow a bed for persons suffering from cancer, by the will of Caroline J. Cammerer.

Meeting of Seaboard Physicians.—The Seaboard Medical Association of Virginia and North Carolina held its nineteenth annual session in Goldsboro, N. C., December 8, under the presidency of Dr. John Rainey Parker, Goldsboro. Dr. William L. Rodman, president-elect of the American Medical Association was the guest of honor at the meeting and delivered an address on "Cancer." Norfolk, Va., was selected as the 1915 place of meeting and the following officers were elected: president, Dr. Israel Brown, Norfolk, Va.; vice-presidents, Drs. Cicero F. Griffin, Winston, N. C.; Beverley R. Kennon, Norfolk, Va.; J. R. Parker, Gatesville, N. C., and John W. Winston, Norfolk, Va.; secretary, Dr. Clarence P. Jones, Newport News, Va. (reelected), and treasurer, Dr. George A. Caton, New Bern, N. C. (reelected).

FOREIGN

Revision of Italian Pharmacopeia.—In August the committee was appointed which is to have charge of the revision of the Italian pharmacopeia. It consists of Prof. E. Paterno, senator of the realm and incumbent of the chair of general and analytic chemistry at the University of Rome; Prof. V. Cervello, professor of materia medica and pharmacology at the University of Palermo; L. Pesci, director of the institute for chemopharmaceutics and toxicology at the University of Bologna; the pharmacist, A. Quercia of Bari, and T. Bosio of Turin.

WAR NOTES

Typhoid Epidemic Denied.—Gen. M. P. Melis, chief of the Belgian Medical Corps, in a London dispatch of December 9, denies the report that typhoid fever is epidemic in the Belgian army.

Red Cross Funds to Turkey.—The American Red Cross on December 16, cabled to the American ambassador in Constantinople, $10,000 to assist in the maintenance of numerous hospitals in Turkey.

The Budapest Red Cross Unit.—The Red Cross unit located at Budapest in charge of Dr. Charles McDonald of New York City, has established a hospital with accommodations for 200 wounded.

Red Cross Work in Servia.—The Servian Prime Minister and the Minister of Foreign Affairs have notified the American Minister at Bucharest, Romania, that the American Red Cross unit, under the direction of Dr. Ryan, has taken over the hospitals at Belgrade, Servia, including the medical personnel and pharmacists.

Artificial Pneumothorax on the Firing Line.—Rist relates that a rapidly progressing tuberculous process in the right upper lobe with stormy onset in September, 1913, was arrested by artificially induced pneumothorax, and the young Frenchman took his place last August on the firing line. For a month he was subject to the vicissitudes of the rapidly shifting front rank in the active campaign but came through it in good condition, free from fever or cough. Some effusion in the pleura had helped to maintain the compression of the lung. A little effusion had been noticed just before he left for the front.

Canada Aids Red Cross Work.—The Canadian Red Cross Society has been requested to equip five field hospitals and three field ambulances for the Canadian Contingent. They will aggregate 2,000 beds, a capacity about four times that of the Toronto General Hospital. They will consist of two general hospitals, of 520 beds each; one clearing hospital, 200 beds; two stationary hospitals, 200 beds each, and three field ambulances, 150 beds each. The Aesculapian Club, Toronto, has voted $200 to the Belgian fund; $100 to the Canadian Patriotic Fund and $50 to the fund for comforts for Canadian soldiers.

LONDON LETTER

LONDON, Dec. 4, 1914.

The War

Among the wounded the almost complete absence of rifle bullet wounds is striking; they constitute only about 1 or 2 per cent. The rest are due to shrapnel and to "high velocity" percussion shells. The shrapnel bullet does not make a very bad wound, though it often drives clothing in, but the wounds made by large pieces of common shell are horrible. Heads, arms, feet, etc., are blown off, and in other cases most dreadful flesh wounds and fractures result. The shell fragments drive clothing and mud deep into the tissues and cause both tetanus and spreading gangrene in many cases. The latter are treated by free incisions and injections of hydrogen peroxid subcutaneously, and if the treatment is begun soon enough, life and sometimes limbs are saved. Most of the tetanus cases are fatal, in spite of prophylactic serum.

GALLANTRY OF ARMY SURGEONS

As stated in previous letters, death has taken a heavy toll from the army surgeons, who have shown great bravery in the discharge of their duties. Only about a dozen Victoria crosses, granted only for extraordinary bravery in the field, have been awarded so far in this war, although our troops have fought with all their traditional valor. Another high distinction is the "Distinguished Service Order" (colloquially called the "D. S. O."), which has been awarded to fifty-eight officers in recognition of their services. The list includes three army surgeons who showed great bravery in attending to the wounded under fire. Since my last list another army surgeon has died of wounds, and another is "missing." In the battleship which was blown up, apparently as the result of an accident, three naval surgeons perished.

THE BELGIAN WOUNDED

Some further particulars with regard to the part played by this country in succoring the Belgian wounded may be of interest. When the Germans occupied all the important towns, the Belgian hospitals fell into their hands. The wholesale exodus of the population included all the wounded who could be moved, and furnished a gigantic problem. The British Red Cross was first approached, but as its duty was to attend to the British wounded, it was unable to use its organization. However, they gladly subscribed $5,000, and a "Wounded Allies Relief Committee" was formed. Subscriptions were raised and a small number of convalescent were brought from Antwerp to England. Premises for a hospital were secured at a seaport, Ramsgate. Two English physicians were sent over to Ostend just before its evacuation, and found the appalling condition of 10,000 wounded and 3,000 more to arrive on the morrow. Every available space and even railway sidings were crowded by the wounded. There were few surgeons or trained nurses and hardly any medical stores. The British government then came to the rescue and sent transports which brought away the wounded to England, where the naval and military authorities helped to disembark them. In the meantime telegrams were sent to the mayors of a number of large towns, asking if they would receive batches of fifty wounded Belgian soldiers and see that they were properly treated at the local hospitals, to which they readily assented. The Admiralty sent to Ostend as many as five transport ships in thirty-six hours, and from October 12 to 15, 12,000 wounded were brought away. At the present time 18,000 wounded Belgians are under treatment in England. When they become convalescent they are sent to private houses whose owners have offered their hospitality. Thus by the cordial cooperation of the government and private citizens this gigantic problem has been efficiently solved.

OUTBREAK OF TYPHOID FEVER IN THE BELGIAN ARMY

An epidemic of typhoid fever is threatening in West Flanders and Northeastern France. Many of the Belgian soldiers have been attacked, which is causing some concern to the British Army Medical Service, lest the disease should spread to our troops who are fighting in close cooperation with the Belgians. Cases are coming into Calais at the rate of about ten a day. The British Red Cross has acted with great promptitude and made an immediate grant of $50,000 for the Belgian soldiers at Calais suffering from typhoid fever. The French authorities have given orders for a ship to lie in the dock basin to which the fever patients will be conveyed as soon as the diagnoses are made, and arrangements for the erection of an isolation hospital are under way. Thanks to the extensive inoculation of the British troops, very few cases have occurred among them.

THE MANUFACTURE OF ANILIN DYES

As most of the anilin dyes are manufactured in Germany and their import has been prohibited since the war, a difficulty has been created in the textile industries. To meet this emergency the government has endeavored to induce British manufacturers of dyes to turn their attention from the making of dyes for export to the making of dyes necessary for our own industries. To aid those manufacturers the government has taken steps to persuade works used for the distillation of coal-tar to produce the intermediate bases of the dyes which hitherto have been mainly obtained in Germany. But these emergency arrangements will supply no more than one-third of the consumption of dyes in this country. It has been proposed to form a national organization for the production of dyes, and the government has offered to support it on the conditions that those engaged in it subscribe the whole of the ordinary capital and that they also undertake to continue to buy their dye-stuffs from this cooperative concern. If the consumers will subscribe $12,000,000, the government is prepared, subject to a certain control, to guarantee debenture interest on another $7,500,000. The government will require that it have two nominees on the board, that it have the right of veto to secure that the concern shall remain permanently under British control, and that the large consumer shall have no advantage in price over the small consumer.

ESTABLISHMENT OF A LARGE HOSPITAL FOR THE WOUNDED

The government has placed at the disposal of the War Joint Committee of the British Red Cross and the St. John Ambulance Association the new Stationery Office in London which will be adapted to the needs of a hospital for the wounded. It is estimated that the hospital will contain 1,650 beds. An appeal is being made to the public for their equipment and money is being subscribed at the rate of about $50,000 a day; $125 provides a bed and its necessary equipment. To each bed so provided will be affixed a tablet with the donor's name.

THE PREVENTION OF VENEREAL DISEASE

A national council for combating venereal disease has been formed with the support of the leaders of the medical profession, the churches and others. It marks an important advance in the campaign initiated by Major Leonard Darwin, president of the Eugenics Education Society. Sir Thomas Barlow, who presided at the inaugural meeting, pointed out that, while war conditions limited the possibilities of the movement in some respects, they also opened up opportunities which must not be missed. The aggregation of large bodies of young men in camps offered them a special field. The military authorities were fully alive to their own duties in this regard, and were even now devising an educational scheme for meeting the need in this great national emergency. If they should require aid from the outside, the medical profession would not be slow to put their shoulders to the wheel. The work was heartily welcomed by Lord Kitchener. But the subject had its civil as well as its military aspect, and there was ample room for cooperation by civil authorities and by organizations for social welfare, and not least by women, both medical and lay, and by those excellent agencies which were providing tents and means of sane recreation for the soldiers. While the problem was primarily medical, its solution could not be attained without the hearty cooperation of every kind of agency for social betterment. He moved that the following aims be the objects: 1. To provide accurate and enlightened information as to the prevalence of these diseases, and as to the necessity of early treatment. 2. To promote the provision of greater facilities for their treatment. 3. To increase the opportunities of medical students and practitioners for the study of these diseases. 4. To encourage and assist the dissemination of a sound knowledge of the physiologic law of life in order to raise the standard both of health and of conduct. 5. To cooperate with the existing associations, to seek their approval and support, and to give advice when desired. 6. To arrange, in connection with such organizations, for courses of lectures, and to supervise the preparation of suitable literature. 7. To promote such legislative, social and administrative reforms as are relevant to the foregoing aims and objects.

THE SALE OF DRINK TO SOLDIERS

Another danger to soldiers is being guarded against. The government has issued an order giving the naval and military authorities power to close all saloons within any area for certain hours, either generally or as respects the members of the army and navy. Attempts to elicit information for the enemy by giving or selling intoxicants to seamen or soldiers is made an offense.

BERLIN LETTER

Berlin, Nov. 24, 1914.

The War

According to the latest reports from the seat of war, the number of cases of typhoid and dysentery observed is still small. Whether the opportunity for infection is lacking or the extensive protective inoculations to which our troops have been subjected against typhoid explain this fact cannot be decided at present. The injection material is prepared for the most part according to the improved process of Fornet, at least in Berlin and in the army laboratories, especially in the Kaiser Wilhelm Academy for the instruction of army surgeons. Also the hygienic institutes of the other federal states prepare typhoid and cholera vaccines. With the exception of two persons who wandered over the border, cholera has not been observed in Germany, which is all the more remarkable since it is constantly prevalent in Austria, particularly in the neighboring province of Galicia, and the communication of the disease is facilitated by the combination of the armies. The troops have also been inoculated against cholera but not to so great an extent as against typhoid. In the proceedings of the individual medical societies, which have almost wholly been converted into unions of military surgeons, tetanus occupies a prominent place as formerly. There is still no agreement as to the success of tetanus antitoxin, but the reports of favorable results seem to be increasing. The injection of magnesium sulphate secured at least a symptomatic success, and many an author believes that he has observed a curative effect. It is quite remarkable to what an extent the scientific enthusiasm of our physicians comes into expression under the difficult conditions in the field. In many places scientific societies have been formed in the hostile countries, where from time to time discussions occur. In Lille, a German clinic has been organized out of the university clinic of the Hospital St. Sauveur, which has been transformed by its conductor, Professor Krönig of Freiburg, into a center of scientific activity for physicians in Lille and its neighborhood. In Namur, a German-Belgian physicians' association has been founded which has already held four meetings with thirty to forty participants under the presidency of the garrison surgeon of that place, Professor Schilling, an investigator of tropical diseases from the Berlin Institute for Infectious Diseases. The interpreter is a Belgian army surgeon who studied in Germany for a number of years. This recalls the fact that also in the Franco-Prussian War Professor Langenbeck founded a scientific association in Orleans. In Berlin almost all of the medical societies have united with the greatest medical association of Berlin and also of Germany, the Berlin Medical Society, so as to scatter the material as well as the audience as little as possible. The society meets once in two weeks instead of every week as formerly, alternating with the army medical society which holds its meetings under the presidency of the former Leipsic surgeon, Professor Trendelenburg, who, since resigning his position, is living in Berlin.

PHYSICIANS IN CIVIL PRACTICE

As may be seen from the meetings of the Berlin Medical Society, the number of physicians still carrying on a civil practice is diminishing, although somewhat gradually. The continual increase of the armies by the addition of the reserves demands, on the one hand, a greater number of field surgeons to accompany them. On the other hand, the number of wounded accumulating in the hospitals demands a greater amount of surgical treatment. Naturally, the demands for this work cannot be limited to those physicians who have served as army surgeons, but now those are employed in their home hospitals who, for any physical causes, have not been found fit for military service. All these physicians are paid a sum of twenty marks ($5) a day in addition to their expenses. Germany does not lack money and food for these purposes. Not only in Berlin but also in practically all other parts of the country, so far as it has not been laid waste on the eastern and western boundaries, there is no scarcity of food to be noted on account of the war. According to the statement made by Professor Rubner, the physiologist, a few weeks ago in an article in the *Deutsche medizinische Wochenschrift*, there is no need to fear the subjugation of Germany by hunger.

Marriages

Ossian H. King, M.D., Vincennes, Ind., to Miss Margaret McDonald of Nashville, Tenn., at Vincennes, December 2.

James L. Stewart, M.D., Boise, Idaho, to Mrs. Modjeska Fleharty of California, at Salt Lake City, November 25.

Robert Maffett Palmer, M.D., Pottsville, Pa., to Miss Olive Frances Mayer of Johnstown, Pa., October 22.

John Percival Hewson, M.D., Orange, Texas., to Miss Anna E. Salmon of Wilkes-Barre, Pa., December 3.

Cecil Harrod Dickerson, M.D., Conway, Ark., to Miss Nine Martin of Indianola, Miss., November 25.

Walter M. L. Ziegler, M.D., Philadelphia, to Mrs. Mary Alice Dolson of New York City, November 28.

Henry Joseph Eugene Newnam, M.D., to Miss Lillian F. Hopkins, both of Philadelphia, November 26.

Clarence Herbert Morian, M.D., Arvada, Colo., to Miss Lelah M. Hart of Denver, December 2.

Garrett Lee Hynson, M.D., to Miss Helen Rebecca Sibel, both of Portland, Ore., November 25.

Henry H. Flood, M.D., Baltimore, Md., to Miss Adelaide Selby of Ivory, Md., November 26.

James Berry Gilbert, M.D., to Miss Edna Ruth Wilson, both of Tulsa, Okla., November 29.

Robert L. Schaffer, M.D., to Miss Millie L. Ochs, both of Allentown, Pa., November 30.

Beverly W. Hall, M.D., Bowman, Ga., to Miss Alva Harris at Rome, Ga., November 12.

Deaths

George W. Lasher, M.D. Rush Medical College, 1872; a Fellow of the American Medical Association and formerly president of the Los Angeles County Medical Association and Southern California Medical Society; for twenty-five years professor of surgery in the University of Southern California, Los Angeles, and since 1910 emeritus professor; for eighteen years house physician of the Hollenbeck Hotel, Los Angeles; died at the home of his office associate, Dr. W. F. Perry, in that city, December 4, from cerebral hemorrhage, aged 69.

Johnston McLanahan, M.D. Jefferson Medical College, 1865; a member of the Medical Society of the State of Pennsylvania; formerly president of the Medical Society of Franklin County and treasurer of the organization for many years; surgeon of United States Volunteers from 1863 to 1866; president of the Board of Health of Chambersburg for several years and a director of the Chambersburg National Bank; died at his home in that city, December 13, from valvular heart disease, aged 70.

Jephtha Vining Harris, M.D. Tulane University, New Orleans, 1861; assistant surgeon and chief surgeon, C. S. A., and assistant surgeon, C. S. N., during the Civil War; a member of the Florida legislature, 1877; superintendent of public instruction of Monroe County, Fla., for ten years, and collector of customs at Key West, from 1885 to 1889; died at the home of his son in Key West, Fla., November 21, aged 75.

William H. Capener, M.D. Western Reserve University, Cleveland, Ohio, 1856; examining surgeon for the Army during the Civil War; surgeon of the U. S. Marine Hospital, Cleveland, in 1860 and 1861; health officer of the city, from 1871 to 1873, and surgeon to the City Infirmary for four years; died at his home in Cleveland, December 2, aged 82.

Gard Wilmarth Foster, M.D. Detroit Medical College, 1873; a member of the Medical Society of the State of New York and a specialist in diseases of the eye, ear, nose and throat of Auburn, N. Y.; while en route to Bermuda in search of health, died December 2, in Schenectady, N. Y., from pneumonia, after a surgical operation.

William Taylor Johns, M.D. St. Louis College of Physicians and Surgeons, 1912; professor of physiology and serology in his Alma Mater in 1911-12; director of the Western Wassermann Laboratories, Muskogee, Okla.; was found dead in his office in Muskogee, December 7, from tuberculosis, aged 39.

Moris Drake, M.D. Medical College of Ohio, Cincinnati, 1881; a Fellow of the American Medical Association and a well-known practitioner of Indiana; died at his home in Shelbyville, December 12, from gastric ulcer associated with and dependent on carcinoma of the stomach, aged 58.

James Harper Ramsey, M.D. Western Reserve University, Cleveland, 1871; a veteran of the Civil War; for several years a member of the school board of Bridgewater, Pa.; and once president of the board of health; died at his home in West Bridgewater, Pa., November 25, aged 79.

Robert Harris Bradford, M.D. North Carolina Medical College, Charlotte, 1904; surgeon for the Inter-State Lumber Company, at Burgaw, N. C.; died in the James Walker Memorial Hospital, Wilmington, N. C., November 25, three weeks after an operation for appendicitis, aged 36.

George Edward Maloy, M.D. University of Vermont, Burlington, 1877; for many years a practitioner of Glencoe and St. Cloud, Minn.; but for the last three years a resident of the Pacific Coast; died at the home of his son in Spokane, Wash., November 25, from carcinoma, aged 59.

James Ball, M.D. Kansas City Homeopathic Medical College, 1893; a Fellow of the American Medical Association; for twenty years a practitioner of Ottawa, Kan.; died in Bethany Hospital, Kansas City, Mo., November 26, after an operation for intestinal obstruction, aged 48.

John M. Fraser, M.D. Western Reserve University, Cleveland, 1881; a Fellow of the American Medical Association; formerly a member of the faculty of the Wooster University Medical College; died at his home in Cleveland, November 30, from cerebral hemorrhage, aged 62.

Baldwin Gardiner Cooke, M.D. College of Physicians and Surgeons in the City of New York, 1879; for more than eighteen years medical and sanitary inspector for the Department of Health of New York City; died at his home in New York City, December 8, aged 59.

William T. Heidt, M.D. Savannah (Ga.) Medical College, 1857; one of the oldest members of the Chatham Field Artillery, Savannah, and surgeon of that organization during the Civil War; died at his home in Bloomingdale, Ga., December 7, aged 77.

Albert Brinkman, M.D. New York University, New York City 1883; for many years visiting surgeon to the Brooklyn Eye and Ear Hospital; died at the home of his brother in Brooklyn, December 7, from the effects of an overdose of morphine, aged 52.

Josiah Claire Violet, M.D. Northwestern University Medical School, Chicago, 1910; a Fellow of the American Medical Association and formerly a resident of Chicago; died in Pomona, Cal., where he had gone in search of health, November 22, aged 32.

Jacob F. Trump, M.D. University of Vermont, Burlington, 1881; a specialist of diseases of the eye, ear, nose and throat of Hamilton, Ohio; died in Mercy Hospital in that city, December 8, after the amputation of his right leg for gangrene, aged 63.

William Robert Moore, M.D. Starling Medical College, Columbus, Ohio, 1889; a member of the Ohio State Medical Association and a member of the staff of the Deaconess Hospital, Ironton, Ohio.; died at his home in that city, December 4, aged 41.

George Dexter Bullock, M.D. Jefferson Medical College, 1886; formerly a Fellow of the American Medical Association; a member of the Massachusetts Medical Society; died at his home in Weymouth Landing, Mass., December 6, aged 55.

George Herbert Burke, M.D. Chicago Homeopathic Medical College, 1898; a member of the Hospital Corps during the Spanish-American War, with tropical service; died at his home in Wabash, Ind., December 4, from heart disease, aged 51.

Thomas Osborne Hunter, M.D. Memphis Hospital Medical College, Memphis, Tenn., 1889; a pathologist and health officer of Biloxi, Miss., and at one time state registrar; died suddenly in Biloxi, December 3, from heart disease, aged 46.

Wesley J. Green, M.D. Atlanta (Ga.) Medical College, 1888; a member of the Medical Association of Georgia; for many years a practitioner of Clayton, Ga.; state senator from 1898 to 1900; died in Clayton, Ga., November 28, aged 51.

Sumner A. Stacy, M.D. New York Homeopathic Medical College, New York City, 1886; died at his home in Adamsville, Ohio, December 4, from valvular heart disease, aged 57.

John Harrod, M.D. Eclectic Medical Institute, Cincinnati, 1887; died at his home in Fort Wayne, Ind., December 8, from heart disease, aged 53.

William Grange Dolan, M.D. Rush Medical College, 1902; a member of the Minnesota State Medical Association and for twelve years a practitioner of Cloquet, Minn.; died in Jacksonville, Fla., December 5, from diabetes, aged 37.

Charles S. Albertson, M.D. Homeopathic Hospital College, Cleveland, 1882; a member of the staff of the Oswego(N. Y.) Hospital and of the Medical Society of the State of New York; died at his home, December 7, aged 62.

Elias Lawrence Brownell, M.D. University of Vermont, Burlington, 1868; a pioneer practitioner of Dickinson County, Iowa; died at his home in Spirit Lake, Ia., about December 2, from sciatic rheumatism, aged 71.

Elden Cromwell Sturman, M.D. College of Physicians and Surgeons, Keokuk, Ia., 1897; a member of the Iowa State Medical Society; died at his home in Hartford, Ia., November 29, aged 45.

Robert W. Sharp, M.D. Eclectic Medical Institute, Cincinnati, 1873; a member of the Ohio State Medical Association; died at his home in Buckland, Ohio, about November 22, aged 64.

Milton I. Hatfield, M.D. Eclectic Medical College of Pennsylvania, Philadelphia, 1870; died at his home in Warren, Ohio, November 30, five weeks after a surgical operation, aged 69.

John W. Morgan, M.D. Medical College of the State of South Carolina, Charleston, 1857; formerly of Minden, La.; died at his home in Coushatta, La., November 29, aged 84.

James A. Wamsley, M.D. Jefferson Medical College, 1878; of Philadelphia; died at the German Hospital in that city, December 4, after an operation for appendicitis, aged 63.

Harvey M. Dally, M.D. Medical College of Indiana, Indianapolis, 1881; a physician and druggist of Pontiac, Ill.; died at his home in that place, November 29, aged 59.

Louis Seraphin Poulin, M.D. University of the Victoria College, Coburg, Ont., 1867; died at his home in St. Alexandre d'Iberville, Que., September 26, aged 70.

Isaac R. Hogue, M.D. Hahnemann Medical College, Chicago, 1892; for many years a school teacher; died at his home in Elkhart, Ind., December 2, aged 82.

Ira John Schott, M.D. Hahnemann Medical College, Chicago, 1887; of Naperville, Ill.; died suddenly from heart disease in that place, November 21, aged 54.

James R. Seymour, M.D. Eclectic Medical Institute, Cincinnati, 1883; died at his home in Raymond, Ill., November 28, from cerebral hemorrhage, aged 65.

Solomon Singer, M.D. University of Toronto, Ont., 1903; a coroner of Toronto; died at his home in that city in October, from typhoid fever, aged 37.

John Edward Waterhouse, M.D. University of Colorado, Boulder, 1912; died at the home of his mother in New Orleans, November 27, aged 26.

Shelvey Maddox, M.D. Eclectic Medical Institute, Cincinnati, 1881; died at his home in Monroe City, Mo., November 28, from diabetes, aged 61.

Alexander Peter O'Malley, M.D. New York University, New York City, 1876; died at his home in Wilkes-Barre, Pa., December 12, aged 61.

John T. Anderson (license, Indiana, 1897) a practitioner since 1893; died at his home in Swayzee, Ind., about December 1, from pneumonia.

John Winfield Reith, M.D. Hahnemann Medical College, Philadelphia, 1905; died at his home in Lancaster, Pa., December 9, aged 32.

Adeline Wilkins Wildes, M.D. Boston University School of Medicine, 1881; died at her home in Roxbury, Boston, December 6, aged 74.

John August Lock, M.D. Eclectic Medical College of the City of New York, 1910; died at his home in Brooklyn, December 4, aged 31.

Thomas Henry Moore, M.D. Maryland Medical College, Baltimore, 1912; died at his home in Willimansett, Mass., October 21, aged 26.

Henry Reid McCullough, M.D. Trinity Medical College, Toronto, Ont., 1887; died at his home in Harriston, Ont., October 21, aged 49.

James Frederick Shurtleff, M.D. Albany (N. Y.) Medical College, 1867; of Rock, Mass.; died in Middleboro, Mass., October 22, aged 72.

Charles Henry Reed, M.D. University of Pennsylvania, Philadelphia, 1878; died at his home in Philadelphia, November 24, aged 62.

Harold Middleton Shephard, M.D. McGill University, Montreal, 1910; died at his home in Ingersoll, Ont., October 20, aged 27.

John Clossom Ray, M.D. University of the Victoria College, Coburg, Ont., 1862; died at his home in Toronto, Ont., October 17.

William S. Turner, M.D. Vanderbilt University, Nashville, Tenn., 1882; died at his home in Blakemore, Ark., December 1, aged 60.

Sidnar Morgan (license, Colorado, ten years of practice, 1900) died at his home in Denver, Colo., November 23, aged 60.

C. H. Bates, M.D. Kentucky School of Medicine, Louisville, 1871; died at his home in Osyka, Miss., September 23, aged 67.

George Mitchell, M.D. Bellevue Hospital Medical College, 1866; died at his home in Wallaceburg, Ont., October 2, aged 78.

Willard A. Hall, M.D. Miami Medical College, Cincinnati, 1876; died at his home in Yoakum, Texas, December 2, aged 63.

Robert Lee Rye, M.D. University of Louisville, Ky., 1897; died suddenly at his home in Porter, Okla., December 4, aged 43.

Allan Aleyne Mathews, M.D. Rush Medical College, 1879; of Oak Park, Ill.; died November 19, aged 61.

Correspondence

Medical Notes on England at War

To the Editor:—I dare say my many friends in the United States and Canada would like to have a few notes of my recent experience during these busy months.

It has been an extraordinarily interesting sight to watch the transformation of a peaceful commercial country into an armed camp. As regards soldiers, four months ago England was in the same blissful condition as the United States. One knew there was an army, but a soldier was never seen. To-day khaki is the "only wear," and there are more than 1,000,000 in training, and some 300,000 at the front, a larger expeditionary force than England has ever had on the Continent. And there is a fine spirit abroad. Every one is working, the Irish question is dead, an intense pride has been raised in the army, there is every confidence in the navy. At the first blush it really looks as if war were a good thing, a fine tonic to the country at large; but behind all this is the tragedy of the shambles at the front, and the hospitals are full of poor fellows battered and shattered, so that one has not to go far to realize the truth of Sherman's famous words that "War is Hell."

For the medical work England was not wholly unprepared. The lessons of the South African War sank deeply and gave a good many men now in the prime of life a most helpful experience. Then in the reorganization of the territorial army five or six years ago the country was divided into military districts, in each one of which a base hospital was organized. Thus Sir Alfred Keogh, the Director-General, and Colonel James came here, met the profession, explained the details of the reorganization, and left the matter in the hands of a committee who nominated the staff, selected the buildings, and arranged for nurses. This was all on paper, but the skeleton was laid down, and the large examination schools selected as the hospital. The plans for the alterations had been prepared, and life had been kept in the organization by an annual meeting. And so it turned out that within two weeks after the order for mobilization, Colonel Ranking, the administrator, had the schools ready for a hospital of nearly 500 beds, and a staff organized. The same has taken place in the other centers throughout the country, so that ample accommodation was provided, both for the sick among the territorials and Kitchener's new army, and for the wounded who soon began gradually to be sent back from the front. At present in Oxford there are nearly 1,000 beds available, as the town hall and the workhouse have been added and about eighty beds provided at the Radcliffe Infirmary. Up to date, between 2,000 and 3,000 wounded have been treated.

Private enterprise has also furnished excellent hospitals. The Committee of American Ladies in London has opened the American Hospital at Paignton, near Torquay in Devonshire, in the splendid house handed over to it by Mr. Paris Singer. There are 200 beds, and an additional sixty beds will be provided. The work is in charge of Dr. Beal of the American Red Cross.

The Canadians resident in London have opened a hospital near Shorncliffe, which is in charge of Dr. Armour and myself, in a house provided by Sir Arthur and Lady Markham. The resident surgeons are Dr. Wallis of Guelph and Dr. Stewart of Calgary. Miss Macmahon of Toronto, formerly one of the assistant superintendents at the Johns Hopkins Hospital, is in charge with a group of Canadian nurses.

From the base hospital in Oxford the convalescents flow over to Blenheim Palace, the library of which has been converted into a ward for sixty patients, and to Lady Wantage's at Lochinge, and to Mr. Mortimer Singer's at Milton Hill. The latter is one of the most ideal hospitals I have ever seen. Mr. and Mrs. Singer were about to move into their newly arranged house, but have converted it into a hospital for 150 beds, and are providing everything for the comfort of the soldiers.

In Cambridge, Birmingham, Bristol and London large hospitals have been opened, and many of the Metropolitan hospitals have set aside a certain number of beds, so that one may say that the accommodation throughout the country both as regards hospitals and convalescent homes is ample.

Altogether, the health of the troops in the training camps has been excellent, and, fortunately, until recently the weather has been good. Up to date there has been no typhoid to speak of. Inoculation is not compulsory, so that a number of us have been going about the camps lecturing to the men, the large majority of whom have readily submitted to inoculation. The country districts in England are singularly free from typhoid, so that there is not much risk of wide-spread epidemics in the camps, and in the British expeditionary forces there have been very few cases. There has only been one case at Paignton, and only four or five here. I saw a couple in the hospitals at Brighton. In these first four months of the war we may say that typhoid has played no part. Major Russell's recent figures of the results of inoculation in the American army have been of great value in convincing officers of the value of the procedure.

The outstanding medical feature of the campaign in France and Belgium is that wounded, not sick, are sent from the front. So far, disease has played a very small part and the troops have had wonderful health, in spite of the exposure in the trenches. The damage has been from the pointed bullet, the round shrapnel bullet, and from fragments of the shrapnel case, and the severity of the wounds caused are in this order. From the military point of view, the modern bullet is not a very effective agent. At the right spot it kills; but it may pass harmlessly through head, chest or abdomen, and may splinter a bone without causing sepsis. The orifices of entrance and exit are small, heal rapidly, and the high velocity appears to sterilize the tract. I have seen one case of bullet through the frontal lobes, four through the chest, and two through the abdomen without serious symptoms. The chest cases are of special interest, as one would not think it possible for a bullet to pass through pleura and lung without damage. At Paignton there have been three cases without pleurisy or hemothorax. In one the bullet entered the second right interspace, passed through the anterior mediastinum and the margin of the left lung and came out in the second interspace, about four inches from the left sternal border. Cough and hemoptysis followed, but the patient rapidly recovered. In another man the point of entrance was to the left of the nipple and the exit below the angle of the right scapula. He spat blood at first, but when I examined him about two weeks later there was no friction, flatness or effusion. A Belgian at Shorncliffe, wounded a week previously by a bullet through the right lung, had the same negative features. The patient in the next bed had hemothorax, with moderate fever, from a bullet which had passed through the right lung at the level of the fourth rib. When hemorrhage follows, there may be fever at first, though not necessarily, and if left alone, the symptoms subside, the clot organizes, the plasma is absorbed, and the affected side becomes immobile, with narrowed interspaces and even rapid contraction.

It would not seem possible that a bullet could go through the abdomen without doing any harm, but a Highlander at the base hospital, Oxford, had the wound of entrance about two inches to the left of the navel and the exit about three inches from the spine. He had had no abdominal symptoms, but had a bad shrapnel wound of the leg. In another man at Paignton the bullet entered from behind, and the roentgenogram showed it not far from the navel. No symptoms followed. The modern rifle bullet may leave a clear wound which quickly scabs over and heals rapidly. A Belgian student at Shorncliffe had a bullet through the bridge of the nose — fortunately a good-sized one — with little or no damage except a frontal sinusitis. The round shrapnel bullet does more harm, with a bigger orifice and a larger, and sometimes rugged, exit. This is an artillery war in which shrapnel does the damage, tearing flesh, breaking bones, and always causing jagged, irregular wounds. And here comes in the great tragedy — sepsis everywhere, unavoidable sepsis! The conditions on the battlefield have made it impossible always to give first aid, and within twelve and twenty-four hours the ragged open wounds have become infected from the clothing or the soil. The surgeons are back in the pre-Listerian days and have wards filled with septic wounds. I have seen sights that remind me of student days at the Montreal General Hospital when all the compound fractures suppurated, and we dressers really had to dress wounds. It may be possible to improve conditions, and already the transport of the wounded from the front has been hastened, and measures are being taken to provide simple antiseptics; but the wound of shell and shrapnel is a terrible affair, and infection is well-nigh inevitable. It is surprising what may be done in some of the worst cases. Among the first batch of German wounded admitted to the Oxford base hospital was a man with high fever, right hemiplegia and aphasia. He had a large wound of the skull on the left side. I saw him with Mr. Whitelocke, as meningitis was feared, but after the wound was freely opened and a part of a bullet and a bit of his cap were removed, the temperature fell, the paralysis cleared, and he has made a complete recovery. An interesting point is the extent of suppurating surface that may exist without fever so long as free drainage exists. It is, however, a slow tedious business, with a type of wound demanding much nursing and dressing. Two points then stand out prominently — the comparative mildness of the wounds of the high-velocity bullet, and the wide-spread prevalence of sepsis in the crusted and lacerated shrapnel wounds.

Two other infections have caused trouble. The fighting has been in highly cultivated districts where the tetanus bacillus thrives, so that many cases have developed. At first there was not sufficient antitoxin, but now it is given at the front as early as possible. There have been only two deaths here among seven cases. At Paignton two very severe cases recovered. The intrathecal method as warmly recommended by Park has been used. The other infection is more serious, an emphysematous wound gangrene, due to an anaerobic gas bacillus. It appears within the first four days of the injury and may prove rapidly fatal by sepsis. The emphysematous swelling, the spreading discoloration, gaseous discharge and terrible odor make the diagnosis easy. The phlegmon bacillus of Fränkel is a widely distributed organism, and infection probably comes from the soil.

There will be countless opportunities of studying lesions of the nervous system, particularly of the peripheral nerves. I have already seen several cases of severe neuritis of the type described in the monograph of Moorehouse, Mitchell and Keen, with great swelling. One patient at the American Hospital with a clean bullet wound high up on the inside of the arm has complete loss of power of the arm, with agonizing pain and great swelling. Later, it would be worth while for the government to concentrate these cases in one large hospital, as was done during the Civil War, and gave the authors just named their great opportunity. Perhaps the case that has interested me most was a paraplegia spastica cerebralis. The man, a private in the Lancashire Fusiliers, had a bullet wound at short range, which ploughed along the parting of his hair for about 3 inches, grooving the bone. It happened on September 13, and he was unconscious for a time, had loss of power in the legs and was carried into the cart. He gradually recovered the use of his legs, but has developed a spastic gait, with great increase in the reflexes. Another point of interest is the paralysis of the flexors of the feet, with some wasting. This makes the gait very remarkable, a combination of the spastic and steppage. No doubt here there was a bilateral hemorrhage, and an anatomic condition similar to that which occurs in Little's disease.

At the Beechborough Hospital there was a remarkable spurious aneurysm, in a Belgian shot through the right cheek; the bullet passed through the mouth, under the jaw beneath the skin of the neck, and was just below the left clavicle. The cervical triangle was filled with a pulsating mass, without thrill or bruit. It appeared to be a traumatic aneurysm, but Dr. Armour removed the bullet, relieving the tension, and the pulsation has gradually disappeared. It was probably hematoma with communicated pulsation. At Paignton there was an arteriovenous aneurysm of the left brachial which seemed doing very well at first, but then began to increase rapidly, so that Dr. Beal did an Antyllus operation.

Considering the distance that the wounded men have had to travel; from the front to the clearing hospital, then by ambulance train to the base hospitals, by ship to one of the ports, then by train or motor ambulance to the general hospitals—well termed a *via dolorosa*—their condition has been remarkable. The mortality has been everywhere very low.

I am sure your readers would like also to hear of the work which is being done to help our Belgian colleagues who have suffered so terribly. Within a week after the fall of Louvain one of the professors called and told such a sad story of their plight that we organized a university committee to offer hospitality to any who cared to accept, and my wife wrote at once to her friends in the United States asking for help. There are now sixteen Belgian professors here, with their families numbering nearly 100, for whom have been provided houses or lodgings, and who are given monthly grants for their support. The money for this has very largely come from our friends in the United States; and I would like here to express the indebtedness of the committee to Dr. J. William White of Philadelphia, and to Mrs. Futcher of Baltimore. The financial position has been greatly relieved by the kind offer of the Rockefeller Foundation to subsidize any science professors who wish to continue their work at English universities. The two most distinguished medical professors are Professor Denys, who is working in the laboratory here, and Professor Van Gehuchten in the Research Hospital at Cambridge, both from Louvain.

William Osler, Oxford, Dec. 4, 1914.

Sodium Chlorid in Bright's Disease

To the Editor:—Dr. Lowenburg's article in The Journal, Nov. 28, 1914, p. 1906, is of immense interest from the point of view of the effects of various mineral salts on metabolism, as well as of sodium chlorid in dropsy.

That sodium chlorid, taken into the circulation, will, under certain circumstances, cause water retention in the tissues (edema), I am fully convinced, but there may be, and there probably is, some other factor necessary for the production of that result. My opinion is that some etiologic factor is to be found in a peculiar condition of the tissues (such condition, in some degree, not unlike what we meet in chilblain cases), as well as in the pathologic condition of the kidneys. It is not generally known, perhaps, that potassium salts will counteract this water retention in the tissues by causing the sodium salts to be eliminated, and some articles of diet, such as potatoes, cereals, etc., which contain potassium in considerable quantities, will often prevent sodium chlorid from producing its characteristic effects on the tissues. Hence, probably one of the reasons for some contradictory results obtained by different clinicians owing to inattention to these details.

I have now in mind one particular case in point, which came under my observation in London, J. G., a man about 50, a plumber by trade, who had an attack of acute nephritis with albuminuria, general anasarca and other characteristic symptoms. The patient improved under treatment and resumed work in the spring of 1907. He felt tolerably well during the summer, but the case eventually ran into the chronic form, the condition of the patient becoming worse every winter through renewed attacks. He was admitted into the Middlesex Hospital during the winter of 1909-1910 and left little improved, to be sent shortly after to the Marylebone Infirmary. At that time he could walk fairly well, but had general edema and ascites. His condition, however, became gradually worse, notwithstanding the treatment he received and the continual use of Southey's tubes to reduce the dropsy, until during the last two months of the six which he remained in that institution, he was quite unable to walk owing to his size and weight from the dropsy. He could only move about in the corridors and in the yard with the use of a bath-chair which he wheeled with his hands. He thought that he would die if he remained there any longer, and he prevailed on his wife to take him out, although she had no other means to support him and herself than her daily labor at scrubbing. This was in the autumn of 1910. I was then asked to prescribe for him. On inquiry, he told me that his diet in the infirmary had consisted chiefly of salt fish and, having read at that time several articles on the effects of sodium chlorid in producing water retention in the tissues, I put him on a salt-free diet and on articles of food containing potash such as unsalted potatoes *ad libitum*, cereals and various vegetables. He also had milk and buttermilk, and was allowed the fat of bacon. The only medicine he had to take was the mistura alba (magnesium sulphate and magnesia) sufficient to keep his bowels in action, and occasional doses of potassium bicarbonate by the mouth. Before the end of three weeks he walked to my office unaided, a distance of more than half a mile, and told me he had lost over 6 inches around the waist, his legs and arms were much reduced in size and he felt much more comfortable. The urine was clearer and contained less albumin. In another month he began to do some work, and when I left London, in May, 1911, he was still able to work to earn his living. I heard of him a few months after I left and was told that he kept fairly well, but I have heard nothing more since.

I feel convinced that, in this instance, the continual aggravation of the dropsy was due to the ingestion of sodium chlorid from the salt fish of the food, and the rapid improvement of the symptoms to the sudden cutting off of the salt supply to the tissues, together with the elimination of sodium chlorid by the administration of potassium salts both as a medicine and in the diet.

It is not improbable, therefore, that the benefits obtained by the administration of Ringer's solution in these cases are due to the potassium contained in it and perhaps also to the calcium. I doubt that the sodium contained in Ringer's solution has any share in the benefits derived from its administration, except in so far as it may be converted, by the presence of potassium and calcium salts, into some other sodium salt having less power to produce water retention than the chlorid and thus be rendered more easy of elimination.

I am inclined to think also that chronic cases of dropsy offer a safer means of finally judging of the effect of sodium chlorid in producing edema than acute ones, because the latter present greater reactive and recuperative powers to overcome the effect of sodium chlorid, even if injurious, than the former. On the other hand, it must be borne in mind that when the elimination of the excessive sodium chlorid is prolonged to a degree of salt starvation of the tissues, which require sodium chlorid as a normal constituent, an opposite condition may be developed which might produce a nephritis of a special character.

Miscellany

Harrison Bill Becomes A Law

During the last three years frequent mention has been made in The Journal of the efforts of Congress to enact a law for the control of traffic in habit-forming drugs. (April 18, 1911, p. 1276; Aug. 2, 1913, p. 360; Jan. 24, 1914, p. 316.) As has been previously stated, two of the three measures known as the Harrison bills were enacted at the last session of Congress. These provided for the regulation of the manufacture and importation of drug preparations containing opium or coca leaves or any of their compounds. The third bill, intended to regulate the interstate traffic in habit-forming drugs, presented difficulties which were not encountered in the other two measures. Congress has no power to enact regulations for the sale of any article within state boundary lines; the question whether or not it has the power to restrict trade in an article solely for the public good is one on which there is a diversity of opinion. Consequently the method resorted to in most restrictive measures of this class is to draft them under the guise of revenue measures and to regulate them through the levying of a tax. This method was followed in the Esch phosphorus bill by which Congress imposed such a heavy revenue tax on matches made with white phosphorus as practically to prohibit their sale as an article of common use. The same plan has been resorted to in the third Harrison bill. This bill, after lengthy discussion and considerable amendment, finally passed the House, June 26, 1913, and the Senate, Aug. 11, 1914. The differences between the amendments made in the House and the Senate were so great as to make it necessary to refer the measure to a conference committee. On October 17, the conference committee reported an agreement and the amended measure was adopted by the Senate, the House adjourning without action. Following the reassembling of Congress, the report of the conference committee was again taken up and on Thursday, December 10, the bill was finally passed by the House. On account of the great amount of discussion which has been excited by the bill and its interest to and effect on the medical profession, an abstract of the law is given herewith.

Explanation of the Bill

The title of the act is "An Act to provide for the registration of, with collectors of internal revenue, and to impose a special tax upon all persons who produce, import, manufacture, compound, deal in, dispense, sell, distribute or give away, opium or coca leaves, their salts, derivatives or preparations and for other purposes."

Section 1 provides that after March 1, 1915, every person who performs any of the acts mentioned in the title shall register with the collector of internal revenue of the district his name and place of business and shall pay a special tax of one dollar a year. Employees of registered persons, officers of the United States government, lawfully engaged in purchasing the drugs named for the army, navy, public health service or government hospitals and prisons are exempt. Only registered persons shall be permitted to perform any of the acts mentioned in the title. The term "person" is expressly defined to include partnerships, associations, companies or corporations.

Section 2 provides that no person shall sell, barter, exchange or give away any of the drugs mentioned except on a written order on a form issued by the Commissioner of Internal Revenue and supplied only to registered persons. Such orders shall be issued in duplicate, the original to be preserved by the person filling the order and the duplicate to be preserved by the person issuing it, for a period of two years and kept so as to be accessible to inspection by any officer of the treasury department or of state, territorial district and municipal officers. The exemptions under this section were the subject of the most prolonged discussion. As the bill finally passed, it provides that this section shall not apply to the dispensing or distribution of any of the drugs named, to a patient, by a physician, dentist or veterinary surgeon registered under the act in the course of his professional practice, provided that the physician, dentist or veterinary surgeon shall keep a record of all such drugs dispensed or distributed, showing the amount, the date and the name and address of the patient, except such as may be dispensed or distributed to a patient on whom such physician, dentist or veterinary surgeon shall personally attend. This record is to be kept for a period of two years, subject to inspection. The sale of any of the drugs mentioned, on a written prescription issued by a physician, dentist or veterinary surgeon, is also exempt but the person filling the prescription is required to keep the prescriptions on file for a period of two years. The sale of drugs to foreign countries is exempt, subject to the regulations of the country importing them, as is also the sale of drugs to any properly authorized government officer or state, territorial, district, county or municipal official purchasing supplies for a public hospital or prison.

The commissioner of revenue is authorized to prepare suitable blanks to be sold to dealers, the price not to exceed one dollar per hundred and the name of the purchaser using the blank is to be written or stamped on it by the collector of internal revenue. No other persons are permitted to use the forms. Special provisions are made for the administration of the act in Porto Rico, the Philippine Islands and the Canal Zone.

Section 3 provides that all persons registered under the provisions of the act shall, whenever required to do so by the collector of the district, make a full and correct statement on oath of the quantity of the drugs he has received and the names of the person from whom he has received them.

Section 4 prohibits any except registered persons from shipping or delivering any of the drugs mentioned in interstate commerce. Common carriers and employees are exempt.

Section 5 provides that duplicate orders and prescriptions shall be open to the inspection of all authorized agents of the treasury department and officers of any state, territory or municipality. Certified copies of such statements can be secured on the payment of a suitable fee. No persons are permitted to disclose the information contained in the returns except in the matter designated above. Copies of the names of all persons listed in any district may be secured on payment of one dollar for each one hundred names.

Section 6 provides that the act shall not apply to preparations or remedies which do not contain more than 2 grains of opium or more than ¼ grain of morphin or more than ⅛ grain of heroin or more than 1 grain of codein to the fluidounce or, in the case of solid preparations, to the avoirdupois ounce or to preparations for external use only or to decocainized coca leaves or other preparations of coca leaves which do not contain cocain.

Section 7 provides that all existing laws for the collection of internal revenue taxes are to be applied to the special taxes imposed by this act.

Section 8 provides that the possession of any of the drugs mentioned on the part of any unregistered person shall be regarded as presumptive evidence of the violation of the law. Employees of registered persons, nurses under the supervision of registered physicians, physicians themselves registered under the act, proper officials, warehouse men holding possession of goods for registered persons and common carriers transporting such goods are exempt.

Section 9 provides a penalty of not more than $2,000 fine or imprisonment for not more than five years or both for violations of the act.

Section 10 authorizes the commissioner of internal revenue to appoint such persons as may be necessary to carry out the provisions of the act.

Section 11 appropriates $150,000 to make the act effective and Section 12 provides that this act shall not be regarded as modifying the national Food and Drugs Act or the act of 1909, prohibiting the importation of opium.

Compulsory Vaccination Compatible with Compulsory School Attendance

(People vs. Ekerold (N. Y.), 105 N. E. R. 670)

The Court of Appeals of New York affirms a judgment holding a father liable for the penalty provided by the education law for a failure to cause his son to attend on instruction notwithstanding the father made the defense that he did not believe in vaccination and the school authorities had refused to allow the child to attend school without being vaccinated. The court says that the question which within certain limits was presented here was whether the statute and the by-laws of the board of education in New York City adopted under and in accordance with the statute requiring vaccination as a condition of attending the public schools were under ordinary conditions so unusual or oppressive that a parent should be allowed to make his unwillingness to comply therewith a basis for not sending his children to school, for that was what the position of the defendant amounted to. The court does not think that they were of such a character. Under this court's decision in Re Viemeister, 179 N. Y. 235, it must assume that the law requiring vaccination of children in the public schools is a proper one. The statute requiring vaccination was adopted in its present form in 1893. The provision requiring attendance on instruction was first adopted in 1894. It does not seem reasonable to assume that it was the legislative intention in passing both of these statutes relating to attendance at school to provide and have it come to pass that the unwillingness to comply with the one requiring vaccination might be turned into a good excuse for disobeying the other one concerning attendance. It does not require much spirit of prophecy to foresee what would follow a contrary construction of the statutes. So far as the evidence disclosed, the defendant's refusal to comply with the requirements of attendance at school was arbitrary and capricious, and as one read the record and argument of his counsel the impression somehow arose that he was more interested in asserting his right to refuse to comply with the law than he was actuated by the purpose of protecting his child from some possible or supposed injury. Moreover, the vaccination statute under consideration applies only to the public schools, while it is well known that there are schools of other kinds and classes which might have been attended by the defendant's child where attendance would not have been subject to the condition which he urged as an excuse for his failure to send his child to school. It might or it might not be that that would entail expense, and even if it did it would not be sufficient to excuse the position and situation of the defendant. We are made well aware at the present day that the government in the exercise of its police powers does impose many regulations which involve trouble and expense, and such trouble and expense have not been regarded as an excuse for non-compliance.

Marriage of Drugged Physician to Nurse Annulled

(Waughop vs. Waughop (Wash.), 143 Pac. R. 444)

The Supreme Court of Washington affirms a judgment annulling the marriage in this case of a physician to a nurse, on account of the mental incapacity of the plaintiff at the time the marriage ceremony was performed. The court says that he was 46 years of age, and she 30 years of age. He had been for many years afflicted with insomnia, and had at times taken drugs in large quantities to overcome it. His mother, to whom he was greatly devoted, had been ill for some time, and he had been her physician and nurse. On Jan. 26, 1913, her condition was so alarming as to cause him great mental worry. Prior to that date he had casually met the defendant two or three times. On and after that date she visited his home daily, and after a day or two kept him at her sanitarium at night and gave him drugs and hot baths, as she said, to produce sleep. She claimed that they became engaged about January 30. He said that he had no recollection of either a courtship or engagement. She kept him under her control until February 4. On the forenoon of that day they applied for a marriage license, which the auditor, at the suggestion of the plaintiff's friends, refused to issue. In the afternoon they met at the home of his pastor, where the plaintiff was examined by two physicians who agreed that he was not then mentally competent to enter into the marriage relation, owing to excessive use of drugs. But despite the advice of the physicians, the advice and protest of the pastor, and the earnest protest of the plaintiff's relatives, they procured a license at 11:30 that night and were married at midnight. They lived together at the sanitarium conducted by the defendant from February 4 until February 12, when the plaintiff left the defendant, and on the next day brought this action to annul the marriage. The court thinks that it was correctly decided that the plaintiff was mentally incompetent at the time of the marriage, and that the marriage was not validated by consummation or ratification. The law presumes sanity rather than insanity, and competency rather than incompetency. It follows that one who asserts his incompetency to enter into a contract, whether it be a contract of marriage or one of another nature, must establish his incompetency at the time the contract was entered into by clear and convincing evidence. It is equally well settled that, where one is induced to make a contract by the artifice or fraud of the other party to the contract, less evidence will suffice to annul it. If the plaintiff's incapacity was such that he was incapable of understanding the nature of the contract, incapable of understanding the obligations assumed by the marriage, or if he was in a state of mental bewilderment to the extent that he yielded without demur to the suggestion of the defendant and she procured the marriage to be entered into, he had a right to secure its annulment, unless he consummated or ratified it after his competency was restored, which he did not do.

Manslaughter in Failure to Provide for Child

(State vs. Staples (Minn.), 148 N. W. R. 283)

The Supreme Court of Minnesota holds that a parent who by culpable negligence fails to provide care, nurture, sustenance, and medical assistance to a child wholly incapable of supplying its own wants, and so causes its death, is guilty of manslaughter in the second degree, under the statute of that state which provides that the offense of manslaughter in the second degree is committed by the killing of a human being, *when done without a design to effect death*, "by any act, procurement, or culpable negligence . . . which . . . does not constitute the crime of murder in the first degree, nor manslaughter in the first degree." The allegations were sufficient in an indictment which charged that the defendant became the mother of a male child, that after its birth and on the same day she wilfully made an assault on said child, and by acts, procurements, and culpable negligence she did wilfully neglect to provide care, nurture, sustenance, and medical assistance and aid to preserve its life, but wholly neglected it, and that in consequence thereof the life of said child was shortened and it did languish and die, etc.

What Constitute Insane Delusions

(Coffey et al. vs. Miller et al. (Ky.), 169 S. W. R. 852)

The Court of Appeals of Kentucky says, in this will-contest case, that an insane delusion is an idea or belief which springs spontaneously from a diseased or perverted mind without reason or without foundation in fact. It is distinguishable from a belief which is founded on prejudice or aversion, no matter how unreasonable or unfounded the prejudice or aversion may be. If it is the product of a reasoning mind, no matter how slight the evidence on which it is based, it cannot be classed as an insane delusion. In everyday life men of the strongest minds, being in possession of the same facts, reach different conclusions. Here the maker of the will, being presumably in possession of at least as much knowledge about certain occurrences as his relatives and neighbors, reached a different conclusion as to who were responsible for them, and the fact that he reached a different conclusion from most of his relatives and neighbors did not make his belief an insane delusion.

AMERICAN

Titles marked with an asterisk (*) are abstracted below.

American Journal of Diseases of Children, Chicago

December, VIII, No. 6, pp. 385-488

1 *Infantile Scurvy: The Blood, Blood-Vessels and the Diet. A. F. Hess and M. Fish, New York.
2 *Experimentally Produced Internal Hydrocephalus. W. E. Dandy and K. D. Blackfan, Baltimore.

1. **Infantile Scurvy.**—A study of the cause of the bleeding in infantile scurvy including a consideration of the clotting-power of the blood, forms the nucleus of the investigation made by Hess and Fish. For the coagulation tests blood was aspirated directly from the blood-vessels and oxalated. This plasma showed a *slight diminution in clotting-power.* This defect did not seem, however, to be the result of an insufficiency of calcium. The antithrombin was not increased. Small amounts of blood were also obtained by puncture of the finger. Examinations of this blood revealed a normal number of blood platelets. In other respects the picture was that of a simple secondary anemia, except that the hemoglobin was diminished out of proportion to the red blood-cells. A marked regeneration of these cells during convalescence, leading to a polycythemia, was also noticed.

These various departures from the norm according to the authors are insufficient to account for the hemorrhages associated with the disease. The integrity of the blood-vessels was therefore investigated. The vessels of normal infants were found to withstand, without apparent disturbance, 90 degrees of pressure for three minutes, whereas the vessels of infants suffering from scurvy gave way under this pressure. Numerous petechial hemorrhages of the skin or mucous membranes were frequently noted as one of the earliest signs of the disease. The well-known "exudative diathesis" of Czerny was found definitely to predispose to the development of scurvy.

Several cases of scurvy developed in infants who were being fed on milk which was pasteurized to 145 F. for thirty minutes. They were cured by receiving fruit-juices or raw milk. Orange-juice was found not to lose its efficacy as the result of being boiled for ten minutes. The juice of the peel was successfully substituted as an antiscorbutic for the juice of the orange. Potato proved to be an excellent antiscorbutic. It is suggested that it be added to pasteurized milk as potato-water instead of the barley-water which is now commonly used as a diluent. In this way the necessity will be obviated of giving orange-juice. Cod-liver oil or olive oil, although given for weeks, did not prevent the development of scurvy.

2. **Internal Hydrocephalus.**—An internal hydrocephalus was experimentally produced by Dandy and Blackfan in dogs by placing an obstruction in the aqueduct of Sylvius. It was made evident that the cerebrospinal fluid is formed in the ventricles faster than it can be absorbed, and that the aqueduct of Sylvius is essential for its escape. An internal hydrocephalus resulted from placing an obstruction in the aqueduct of Sylvius in spite of the extirpation of the choroid plexus of both lateral ventricles. An internal hydrocephalus may also result from an experimental ligation of the vena Galena magna near its origin; when the ligature is more distally placed or when the sinus rectus alone is ligated, an internal hydrocephalus does not result, owing to the efficient venous collateral circulation. Cerebrospinal fluid is derived mainly from the choroid plexuses, probably both by filtration and by secretion.

An increase of cerebrospinal fluid is caused by general venous congestion as demonstrated by temporary jugular compression. This increase of fluid ceases when the congestion is relieved by the collateral circulation. Drugs and glandular extracts produce but slight change in the rapidity of formation of cerebrospinal fluid. Pilocarpin produced a slight increase. There is a rapid constant formation and absorption of cerebrospinal fluid. A new supply is formed and absorbed at least every four to six hours. Cerebrospinal fluid is absorbed directly into the blood from the entire subarachnoid space. It is a diffuse process. There is practically no absorption from the ventricles.

The maintenance of an equilibrium between the formation and the absorption of cerebrospinal fluid necessitates a communication between the ventricles and the subarachnoid space. Communication is solely by the foramina of Magendie and Luschka. After the introduction of phenolsulphonephthalein into the subarachnoid space it soon appears in the lateral ventricles. There are therefore no valves at these openings. If an obstruction exists at the aqueduct of Sylvius, phenolsulphonephthalein does not appear in the spinal fluid. The so-called foramina of Mierzejewsky and Bichat therefore do not exist.

In seven patients with internal hydrocephalus lack of communication was demonstrated clinically. In each of these seven cases there was practically no absorption from the ventricles, while the subarachnoid absorption was high. The internal hydrocephalus, therefore, resulted because the passage of fluid from the ventricles into the subarachnoid space was prevented. Four cases of internal hydrocephalus in which there was communication between the ventricles and the subarachnoid space were studied. In these cases there was a low subarachnoid absorption. Meningitis was the cause of the hydrocephalus in two patients with the obstructive type and two with the communicating type of hydrocephalus. The probable cause of internal hydrocephalus following the excision of a meningocele is the limitation of absorbing surface and consequent diminution in the absorption of cerebrospinal fluid.

The authors point out that surgical treatment differs according to the variety of internal hydrocephalus. In the obstructive type the obstruction must be removed. In the communicating type it is necessary to increase the area for the absorption of fluid.

13 Cinematoplastic Amputations. Report of Two Cases. A. P. C. Ashhurst, Philadelphia.

3. **Biliary Surgery.**—An analysis of 270 cases operated on within a period of fifty-one months with 13 deaths is presented by Erdmann. His records show 54 cases of acute cholecystitis; 34 cases of gangrenous cholecystitis, and 115 cases of cholecystitis not otherwise classified—this series included all varieties, from non-inflammatory to hydrops. There were 6 cases of perforated cholecystitis; 6 non-calculous; 4 malignant, and 8 cases of hydrops; cholangeitis 23 cases. In addition, acute hemorrhagic pancreatitis, with suppuration or sloughing, was observed six times. The operations recorded were as follows: Cholecystostomy, 125 cases, with 5 deaths. Cholecystectomy, 96 cases, with 4 deaths. Choledochotomy and transduodenal choledochotomy, 5 cases in all with 2 deaths. Cholecystostomy, with choledochotomy, 17 cases, with one death. Cholecystectomy with choledochotomy, 27 cases, with one death. Cholecystotomy with and without combined operations on the duct, 142 cases with 6 deaths. Cholecystectomy, with and without combined operations on the ducts 123 cases with 5 deaths.

4. **Retention Cysts of Pancreas.**—Speese's patient, a male aged 59, noted a feeling of discomfort in the epigastrium six years ago, and at times suffered from pain which radiated from the epigastrium to the lower dorsal region. Coincident with the discomfort, he experienced a sensation of pulsation in the upper portion of the abdomen, and several months ago was able to palpate a mass in the midline above the umbilicus, in the situation in which the pulsation was present. The mass would disappear for a time, then reappear, and of late has been present only in the standing posture. He has lost about six pounds in weight and has had several attacks of jaundice.

Physical examination showed in the epigastrium a pulsating mass which seemed to blend with the abdominal aorta. There was no tenderness or rigidity. Gastric analysis: Free HCl, 0; total acidity, 20; trace of lactic acid; occult blood, 0. Microscopic examination showed much mucus, starch granules and a few Oppler-Boas bacilli. Urine examination negative. Blood: Hemoglobin, 60; red blood-cells, 3,800,000; white blood-cells, 9,900.

At operation the stomach, duodenum and gall-bladder were found to be normal. In the folds of the gastrohepatic omentum a cystic tumor was found, the contour was irregular and the mass was about the size of a large peach. On the posterior aspect it seemed to be in relation with the vena cava and adherent to the head of the pancreas, so that in removing it a thin layer of pancreatic tissue was carried away with the tumor. The rent left in the gastrohepatic omentum was closed with a purse-string suture, leaving a small opening for a drainage tube. The patient made an uninterrupted recovery and was discharged cured. The tumor was composed of numerous cysts, the largest of which measured 2 cm. in diameter, the lining is smooth, and the contents consist of a cloudy fluid. In the center of the tumor, and surrounded by the multiple cysts, is a dense mass of whitish tissue which has the consistency of cartilage and contains several points of calcification.

7. **Rupture of Bladder.**—A case of intraperitoneal rupture of the bladder is reported by Clark which was not operated on until twenty-four hours after the rupture. The rupture of an apparently healthy bladder occurred without any sign of history of direct injury to the organ. After a day of heavy drinking, the patient slipped and fell down four or five steps in a sitting posture. He was immediately nauseated and vomited the contents of his stomach. He then started to walk home, twenty blocks away, and though seized with severe abdominal pain, he was able to reach his home, undress and go to bed. After a sleepless night, due to continued abdominal distress, he rose dressed about noon and went to a hospital.

The patient was prepared for operation. The usual suprapubic exposure showed a bladder extraperitoneally intact. The abdominal cavity being opened, a considerable quantity of urine and blood-clots were mopped out. A jagged transverse rent in the roof of the bladder, easily admitting three fingers, was found. The rents were closed by three layers of catgut sutures, placed successively through mucous membrane, muscular and peritoneal coats. The abdominal cavity was then closed in the usual way, with a cigarette drain and a catheter retained in the bladder. The patient sustained practically no shock from the operation and the postoperative course was uneventful. The retention catheter was removed after eight days and the patient was catheterized for a period of three or four days after which he was able to pass his urine easily. He was out of bed on the fourteenth day, and on the nineteenth day after operation, he seemed perfectly well and strong.

8. **Operative Treatment of Acute Epididymitis.**—Smith and Frayser are of opinion that in acute epididymitis epididymotomy is the rational thing to do because it shortens the duration of the disease; relieves the severe, weakening, sickening pain at once, causes the temperature to fall and induration to disappear rapidly.

24 *Case of Abdominal Pregnancy. W. Himmelsbach, Watsonville.*

14. **Primary Sarcoma of Stomach Treated by Partial Gastrectomy.**—Huntington's patient was a woman, aged 67. The main trouble seemed to have originated within a comparatively short interval extending over a period of six months, during which time her symptoms were not especially distressing. There was never any vomiting of food or evidences of hemorrhage in the stools. She suffered very little pain and only moderate distress, after the ingestion of solid food. Her appetite was fairly well maintained and her physical condition was such as not to attract attention, save in a general way. There was a notable drop in the patient's strength and vigor.

The feature of the case which seemed of special significance was the existence of tenderness on pressure at or near the pyloric region. This was constant, and on the increase during the past two months; pyloric insufficiency existed only in a comparatively moderate degree. There was, also, a slight loss of weight, six pounds in six months. The abdomen was opened through the inner border of the right rectus. On the stomach side of the pylorus there was a rounded mass about the size of a cherry lying apparently in the submucous and muscular coat of the viscus. Between the examining fingers, the peritoneum being tightly drawn over the mass, it presented a whitish uniformly globular tumor. It was distinctly hard and resistant. The lumen of the pylorus was definitely narrowed.

About one-fifth of the stomach and fully an inch of the duodenum were included in the resection. The divided ends of the stomach wall and the duodenum were enfolded and the suture lines reinforced. A formal posterior gastrojejunostomy was then completed. Patient left the hospital in splendid condition at the end of ten days. Section showed tumor to consist of very numerous, round, spindle-cells. Diagnosis: Fibrosarcoma of the stomach.

1 War and Typhoid. W. Osler.
2 *Report on Gas Gangrene. A. A. Bowlby and S. Rowland.
3 Injuries to Bowel from Shell and Bullet Wounds. P. Lockhart-Mummery.
4 Leeches. A. E. Shipley.

2. **Report on Gas Gangrene.**—The following conclusions are drawn by Bowlby and Rowland from their observations of this condition. All tight bandages and especially those applied at the first field dressing should be avoided. Shell wounds are so often followed by so much interstitial hemorrhage that the part swells and the bandage rapidly becomes tighter and interferes with the circulation. Consequently many bandages require to be cut within a few hours of their application. In many cases the tension requires to be relieved by incisions and drainage, and the opportunity should be taken to wash the wounds thoroughly with an antiseptic. Hydrogen peroxid is one of the best. Great care should be taken to remove portions of clothing as these contain the infective agent. Shattered fragments of bone and pieces of shell or gravel should be taken out. Amputation may often be successfully performed through tissues made emphysematous by gas but not yet gangrenous.

The group of anaerobes causing gangrene are spore-bearers, and spores (especially of this group of anaerobes) are especially difficult to kill by any antiseptic solution or even by boiling. Consequently, in order to sterilize instruments and other things that have been infected, other measures are required. (a) Destruction of blankets and clothing soaked by the discharge. (b) Heating in an autoclave at a temperature of 120 centigrade. (c) Boiling for an hour in a solution of 1 in 20 phenol or lysol (1 in 10). The mud on the clothes of wounded soldiers is almost certainly infected, and care should be exercised to see that the area in which operations or dressing of wounds are performed should be kept free from possible contamination from such a source. When possible, it is advisable to isolate patients under treatment in hospitals, and this is all the more necessary on account of the bad smell which is inseparable from the condition.

5 Patient and Disease. D. Duckworth.
6 *Myeloid Sarcoma; Analysis of Fifty Cases. M. J. Stewart.
7 *Heart-Block in Acute Rheumatic Carditis. A. E. Naish and A. M. Kennedy.
8 Localization of Bullets and Shrapnel. W. Overend.

6. **Myeloid Sarcoma.**—In every one of the fifty cases recorded by Stewart the diagnosis was confirmed or made by microscopic examination of the tumor. Of the 50 cases, 35 are from the jaws, 11 from the long bones, and 4 from other situations. The situation in 26 out of the 35 jaw cases was: Upper jaw, 12; lower jaw, 13; both jaws, 1. The incidence in other bones was: Femur, 6 (4 lower end and 2 upper end); humerus, 3 (2 lower end and 1 upper end); metacarpal, 3; tibia, upper end, 1; radius, upper end, 1; and coccyx, 1.

Stewart concludes from analysis of these cases that myeloid sarcoma is locally malignant only and does not undergo dissemination. It is to be clearly distinguished, both clinically and pathologically, from malignant giant-cell sarcoma, in which death with visceral dissemination is the rule, even after the most radical operative treatment.

The histologic diagnosis is based on the morphologic characters of the giant-cells, especially as regards their nuclei. In myeloid sarcoma the latter are numerous, uniform, small, and without mitoses; in malignant giant-cell sarcoma they are few, sometimes single, irregular, and often very large, while mitotic figures are frequent. Stewart makes a strong plea for the conservative treatment of myeloid sarcoma. He advocates thorough curettage as the operation of choice in the first instance in suitable cases; failing this, a local resection of the growth. Amputation should be the last resort, and only after the failure of less radical measures. An accurate histologic investigation of the tumor is in all cases essential.

7. **Heart-Block in Acute Rheumatic Carditis.**—Naish and Kennedy report two cases of heart-block which occurred in the course of acute rheumatic carditis in children and were associated with similar histologic changes in the cardiac musculature.

Berliner klinische Wochenschrift

November 9, LI, No. 45, pp. 1781-1804

9 Gunshot Wounds of the Stomach. (*Perforierende Schussverletzungen des Magens.*) Adler.
10 *Tetanus. H. Mühsam.
11 Gunshot Wound of Spinal Cord. (Rückenmarksverletzung.) E. Froehlich.
12 *Treatment of War Wounds of the Eyes. (*Die Kriegschirurgie des Sehorgans.*) K. Steindorff.
13 *The Symptoms of *Brown-Séquard's Paralysis.* M. Bernhardt.
14 *Renal Diabetes. C. D. de Langen.
15 Factors in Hernia of the Diaphragm. (Zur Entstehung der Hernia diaphragmatica und Dilatation des Zwerchfells.) F. *Fidler.*

10. **Tetanus.**—Mühsam remarks that other germs which get into the wound with the tetanus bacilli use up the oxygen and thus favor the anaerobic proliferation of the tetanus bacilli. Another favoring factor is the demoralization of the circulation in the injured tissues in the depths of the wound. The toxins generated may diffuse through the devitalized tissue into sound tissue until they reach a nerve. The practical

inference is to clear out all devitalized tissue and saprophytes, etc., liable to use up the oxygen, and, last, but not least, to flood the depths of the wound with oxygen in addition to the routine treatment with antitetanus serum and sedatives as indicated. Hydrogen dioxid is another important aid in treatment. It may be necessary to make a breach in the teeth, when the jaws are locked together, so that the patient can expectorate. From lack of any gap in the teeth he lost a patient from aspiration pneumonia as the man was unable to spit although his condition otherwise was not so serious. Local warmth sometimes aids in the subsidence of the trismus.

12. **Injuries of the Eyes in War.**—Steindorff cites the statistics in this line from the wars of the last seventy years and discusses the management of cases of the kind.

13. **Brown-Séquard's Paralysis.**—The patient whose case is described is a man of 45 who has been under observation for six years. The disturbances have never been severe enough to interfere with his work as a railroad employe. The Wassermann test was positive and the motor symptoms improved under specific treatment but the sensory disturbances were not influenced. The syphilitic nature of the trouble is confirmed by symptoms which indicate three distinct foci in the left spinal cord, although there was no history of known syphilis and the man's wife and two children are healthy.

14. **Renal Diabetes.**—This article has already been reviewed in The Journal, Feb. 28, 1914, p. 739.

24 Connection between Instability of the Vagus System and Seasickness. (Ueber die Korrelation der Vagotonie zur Seekrankheit.) B. O. Pribram.

23. **Psoriasis.**—Spiethoff discusses the various theories that have been advanced in regard to the origin of psoriasis, but does not think that any of them have conclusive weight. An inherited tendency seems evident in about 5 or 6 per cent. of the cases, and anything causing internal disturbances is liable to aggravate the condition or bring on attacks, especially digestive disturbances, abuse of coffee, tobacco or alcohol, a diet too rich in albumin, or constitutional disease. One of his most inveterate cases of psoriasis was in a man with exophthalmic goiter. In another case so severe that the scalp and ears were covered with crusts, tests of the stomach functioning revealed anacidity. When diabetes and glycosuria can be excluded, benefit is often derived from a vegetarian diet. As to symptomatic measures, he does not rank any very high except Roentgen exposures. These are peculiarly effectual in the old cases with tough infiltrations on the limbs and head. Among the internal remedies he thinks that arsenic seems to be the only one that is worth mentioning; he has never seen any effect from salvarsan. Patients with severe psoriasis, taking a course of salvarsan for syphilis, did not find that the medication had any influence on the psoriasis. Serotherapy is inconstant in its action, but he extols the benefit from venesection in cases with much itching. Withdrawing from 50 to 100 c.c. of blood, repeating this two days later, generally put an end to the itching in his experience with it.

37 Typhus and Relapsing Fever. (Ueber Fleckfieber und Rückfallfieber.) Mühlens. Commenced in No. 44.

25. **Localization of Foreign Bodies with the Roentgen Rays.**—Holzknecht gives an illustrated description of the various technics best adapted to locate foreign bodies in the skull, limbs and trunk. He emphasizes the importance of heeding the geometrical principles involved.

27. **Varnish for Dressing Wounds.**—In the Balkan wars and in the present war extensive use has been made of a varnish applied around the wound as this fastens in all germs and the wound is thus saved from contamination from the environment. Another advantage is that the dressing sticks to the varnish and is thus held better in place. Opinions differ as to the value of varnish treatment, some lauding it and others finding it inconvenient. Dieterich says that if a varnish is to be used, dammar, colophonium and turpentine are just as good for the purpose as the more expensive resins, and they can be dissolved in benzol instead of chloroform, the cost thus being only a small fraction of that of ordinary varnish. He gives some formulas for a good inexpensive varnish of a neutral reaction, and thus non-irritating. One formula calls for 250 gm. dammar; 30 gm. castor oil or linseed oil; 700 gm. benzol; 50 gm. sodium bicarbonate and 5 drops of amyl acetate (*Birnenäther*). These ingredients are shaken up together repeatedly as they are kept at room-temperature for several days. Then the mixture is filtered, adding a little more of the solvent if any has evaporated. A few drops of the amyl acetate are then added to the mixture, when it is ready for use. Another formula is a mixture of 300 gm. light colophony; 20 gm. Venetian turpentine; 10 gm. castor or linseed oil; 700 gm. benzol, 60 gm. sodium bicarbonate and a few drops of amyl acetate.

28. **The Base Hospital.**—Schridde mentions a number of practical points he has learned in his service at Dortmund in which large numbers of sick and wounded soldiers have been received. With a special ward for skin and venereal diseases the men are cured much quicker than in the mixed wards and his special ward is always crowded. Experience has also confirmed the advantages of keeping the military and the civilian sick separate. He states that prisoners are treated in every respect the same as the other inmates of the hospital except that they are not given reading matter, games, tobacco or dainties sent in from outside; they are not allowed to leave their ward, and no visits are permitted from outsiders. The hospital also takes women in training for Red Cross nursing, rejecting all those who do not seem strong and well or who have much disturbance at menstruation.

30. **Gaseous Gangrene.**—Fraenkel says that when there is no superposed infection the gaseous gangrene is not accompanied by suppuration. It is in fact a malignant emphysema. It can be differentiated from malignant edema in twelve or eighteen hours by inoculation of animals, the guinea-pig for

gas-gangrene, the rabbit for malignant edema, the rabbit being apparently completely refractory to the germ of gas-gangrene. Staining a smear with a diluted solution of carbol-fuchsin will show the gas bacillus with its rounded ends, instead of the beveled ends of the anthrax bacillus, and its short thick shape distinguishes it from the slender bacillus of malignant edema. The bacillus of gas-gangrene is strictly anaerobic, and consequently treatment must aim to admit air freely to check its growth. Ample incisions and playing a jet of oxygen on the tissues, with extensive use of hydrogen peroxid, are the main reliance. If these fail, amputation may save the rest of the body. No serotherapy or internal measures have yet proved of use, but the patient's strength must be kept up.

Franke relates that in his six cases of gaseous phlegmon it developed several days after a shell wound in the leg. The onset was sudden and stormy, the limb became painful and discolored, the symptoms and aspect resembling those of acute and rapidly progressing venous thrombosis except for the accumulating gas. The zone of demarcation was more painful on pressure than the peripheral region. Amputation was the only recourse in four cases, and it came in time in two. In the two others the trunk was already involved and the patients seemed doomed, but one was saved by exarticulation of the thigh; the emphysema in abdomen and chest then promptly subsided. The other patient was febrile and did not survive the operation.

33. **Anaphylaxis from Antitetanus Serum.**—Simon had four rapidly fatal cases of tetanus among the 700 wounded in his service during four weeks. Then came a series of four mild cases with recovery under antitetanus serum treatment. In two other cases tetanus developed soon after a shell injury of the upper arm. One man was given 200 antitetanus serum units, both intravenous and intraspinal, repeated the next day and followed daily with 100 units intravenously after the arm had been amputated. He was progressing favorably until the intravenous injection the fourteenth day was followed by signs of severe anaphylaxis. Under stimulants in an hour he recuperated. The next day he developed an exanthem. No further antitoxin was given and in a few days all traces of the tetanus had vanished. In the other case there was some twitching in the arm and face but as this subsided after intravenous injection of 300 units, the assumption of tetanus seemed to have been erroneous. Thirteen days later the symptoms returned in a severe form and the intravenous injection of 300 units was repeated. It was followed in a few minutes by cyanosis, a chill and temperature of 40.9 C., but the pulse kept good. After this partial shock had subsided there was no return of the symptoms of tetanus. Three days later, the seventeenth day after the first injection, 100 units were injected intravenously again, and this time a typical severe anaphylactic shock ensued at once, with total unconsciousness for half an hour and marbling of the body, the pulse scarcely perceptible, and finally a chill and temperature of 40.1 C. The recovery from the shock was rapid and complete in both cases. By the next day the pulse and breathing were normal and the men felt none the worse for it. These cases suggest that the tenth day seems to be the danger line. In a more recent case, after the patient had been given 1,000 units of the serum in the course of ten days, Simon changed to magnesium sulphate, injecting subcutaneously every day from 40 to 60 c.c. of a 25 per cent. solution. This patient is now practically cured.

34. **Treatment of Tetanus.**—Eunike reiterates that magnesium sulphate treatment is only symptomatic, and that antitetanus serum should never be neglected in treatment. In his eight cases, the five with the most serious syndrome were not influenced by the drug. In the other cases great benefit was apparent although the tetanus was of a severe type. The sulphate was given by intradural injection of 10 c.c. of a 10 per cent. solution; a second dose of 8 c.c. was given three days later as symptoms returned. Disturbances in hearing and hallucinations followed one of the injections in each case, but the tetanus was materially relieved in both after each injection.

35. **Tetanus.**—Angerer extols the excellent results he has had recently in the twenty-four cases of tetanus in his service treated by antitetanus serum plus 5 gm. of chloral in an enema twice a day, or 10 gm. once a day, supplemented by one or two doses of 0.01 gm. morphin. By this means the patient is kept drowsy, in a kind of twilight sleep, and thus is spared all nervous shocks from without. The results have been very encouraging. He has discarded magnesium sulphate as his experiences with it were very unfavorable. He keeps up the antitetanus serum, 100 units both intraspinally and subcutaneously, until the symptoms show a turn for the better—the amounts thus totaling from 300 to 1,600 units.

41 Serovaccine Therapy in Tuberculosis. (Il trattamento Bruschettini nella cura della tuberculosi.) A. Cadani and A. Carafoli.

40. **Experimental Research on the Pituitary Body.**—Scinicariello thinks he is justified in affirming on the basis of his research on three dogs and a bitch, that the pituitary body is not a vitally indispensable organ and that its destruction *in situ* does not entail psychic disturbances if there are no other lesions, tumors, etc., to compromise the functioning of the brain. After destruction of the hypophysis no motor or sensory disturbances were observed, no macroscopic changes in the shafts of the long bones, nor any tendency to obesity. As late as four months after the destruction of the pituitary body, one bitch conceived and bore an apparently normal litter; delivery proceeded apparently physiologically although the hypophysis was supposedly entirely destroyed and no trace of it was found post mortem.

Hygiea, Stockholm

LXXVI, No. 20, pp. 1137-1199

42 *Spontaneous Subarachnoidal Hemorrhage. (Spontana subarachnoidalblödningens patologi och diagnostik.) A. Forsheim.

42. **Spontaneous Hemorrhage in the Subarachnoidal Cavity.**—In Forsheim's first case the patient was a previously healthy woman of 20 who was taken suddenly with symptoms suggesting acute spinal meningitis. The attack was like an apoplectic stroke, the patient falling but not losing consciousness, complaining of intense headache and pain in the spine. She vomited several times and lay with her head thrown back, the pain in the back of the neck increasing when it was straightened. The Kernig-Lasègue signs were positive alike on both sides. There was no nystagmus nor paresis; the diagnosis of subarachnoid hemorrhage was made at once and ice was applied to the head and spine and calcium chlorid and acetyl salicylic acid were given. The next day lumbar puncture released blood-stained cerebrospinal fluid under very high pressure (330 mm.) and the patient was relieved immediately. The proportion of reds and whites was about the same as in the blood and there were no clots. Lumbar puncture the following day showed still a pressure of 220 mm. but it dropped to 120 mm. after withdrawal of 20 c.c. Continued improvement followed, the temperature dropped to normal the fourth day after the second puncture and recovery was soon complete. The hemorrhage occurred while she was pumping water. The second patient was a youth of 17 and nine lumbar punctures were required. The onset and course were the same as in the first case. The fluid was under 450 mm. pressure at first, the pulse 60. The pressure kept high, over 300 mm. during the period of the first seven lumbar punctures, but there did not seem to be any additional hemorrhage after the first. Both patients recovered completely. Forsheim warns of the necessity for recording the pressure in the fluid, not allowing it to drop too low during the procedure, and repeating it at need.

Book Notices

A Text-Book of the Diseases of the Nose and Throat. By Jonathan Wright, M.D., Director of the Department of Laboratories, New York Post-Graduate Medical School, and Harmon Smith, M.D., Surgeon to the Throat Department of the Manhattan Eye, Ear, Nose and Throat Hospital. Cloth. Price, $5 net. Pp. 683, with 327 illustrations. Philadelphia: Lea & Febiger, 1914.

Any work fathered by this well-known pathologist must command the respect of the profession, and those who are familiar with the clear, carefully prepared articles of the gifted secretary of the American Laryngological Association will necessarily be attracted by this greater work. It is largely devoted to the etiology and pathology of the diseases of which it treats, but the symptomatology and diagnosis, the topical and operative treatment of the diseases of the upper air passages have not been neglected. The work is comprehensive and yet fairly concise, and goes directly to the point without tiring the reader with a mass of speculation and unproved theory. The equipment and methods of examination are well described in the first chapter. The second chapter is devoted to the embryology and anatomy of the nose, its external deformities and their correction. The third chapter considers the anatomy, histology and physiology of the internal nose, thus furnishing a foundation on which the student may build a consistent system of diagnosis and treatment of the numerous abnormal conditions of this region. The anatomy, embryology and histology of the pharynx and larynx each have a separate chapter. The numerous diseases of these parts have all been carefully considered and treated in a manner especially adapted for the practitioner who wishes to know, and for the student trying to learn. The book is admirably illustrated and is arranged for quick and accurate reference by the man in active practice, which gives it especial value; but it also is peculiarly adapted to the needs of students who have not had experience in this field.

Technic der Speziellen Klinischen Untersuchungsmethoden. Herausgegeben von Prof. Dr. Theodor Brugsch, 1 Assistent der 11 Medizinischen, und Prof. Alfred Schittenhelm, Direktor der Medizinischen Universitatsklinik in Königsberg. Second edition, Parts 1 and 2. Paper. Price, 36 marks. Pp. 1078, with 476 illustrations. Berlin: Urban & Schwarzenberg, 1914.

These two volumes form the second part of the authors' "Lehrbuch klinischer Untersuchungsmethoden," the first part of which appeared a few years ago. In this section have been grouped the special laboratory methods, which are such valuable adjuncts to the more direct clinical examination of the patient. The subject-matter of these volumes is varied, covering pathologic, bacteriologic, serologic and chemical methods which may be employed in the effort to reach an accurate diagnosis. The work is entitled to rank with the older one of Sahli, which has so long been regarded as the most authoritative one on the subject. Although these volumes do not take the place of those dealing with special fields of laboratory diagnosis, yet they may be recommended to the student and laboratory worker as a reliable and fairly comprehensive guide.

The Medical Record Visiting List or Physician's Diary for 1915. Leather. Price, $1.50. New York: William Wood & Co., 1914.

Practitioner's Visiting List for 1915. Leather. Price, $1.25 net. Philadelphia: Lea and Febiger.

The Physician's Visiting List for 1915. Leather. Price, $1.25. Philadelphia: P. Blakiston's Son & Co., 1914.

The visiting lists for 1915 follow in general the style adopted in previous years. The make-up is the same as to arrangement of pages and sections for memoranda.

The Medical Record Visiting List contains a calendar, obstetric table, table of approximate equivalents, dosages, a list of solutions for subcutaneous injection and for atomization and inhalation, some miscellaneous hints, information on the treatment of poisoning and emergencies, artificial respiration, signs of death, and hints on the writings of wills.

The Practitioner's Visiting List gives information on dentition, a note on estimating the date of confinement, comparative scales of weights and measures, a section on the examination of the urine, a table of incompatibilities, a note on artificial respiration, a table of the eruptive fevers, a list of poisons and antidotes, a table of doses given in apothecaries' and metric systems, and a list of therapeutic reminders similar to that published in various handbooks issued by drug houses. Finally there is an article on the ligation of arteries.

The Physician's Visiting List is issued for various numbers of patients. It contains a calendar, a table for calculating the period of uterogestation, an article on incompatibilities, the treatment of poisoning, tables of weights and measures, a dosage table which gives official and unofficial drugs in both apothecaries' and metric systems, a table of quarantine periods in infectious diseases, an article on the treatment of asphyxia and apnea, and a comparison of the thermometric scales.

The Cancer Problem. By William Seaman Bainbridge, A. M., Sc.D., M.D., Professor of Surgery, New York Polyclinic Medical School and Hospital. Cloth. Price, $4 net. Pp. 534, with 38 illustrations. New York: The Macmillan Company, 1914.

The purpose of this book is to give in succinct form such a summary of the knowledge concerning cancer as may be of value to the general practitioner, the specialist, the intelligent layman and the lecturer on health matters. There are fourteen sections: on history, the major part being devoted to the history of modern cancer research; general distribution, botanical, zoological, geographical and ethnologic; statistical considerations; etiology; histopathology; cancer research—a summary of the world's work; clinical course; prophylaxis; investigation of cancer cures; non-surgical treatment; surgical treatment; irremovable cancer; institutions for the care of cancer patients, and on the campaign of education. This enumeration indicates that every phase of the cancer problem receives consideration, and it must be said that the object of giving a dependable summary of our knowledge of cancer for the large circle of readers has been accomplished with success. The various theories are stated clearly, the statements of facts are reliable, the practical deductions are sound, and an attitude of openmindedness is maintained in regard to all open questions. Being a fluent writer, the author often uses many more words than necessary, and quite a little detail has been introduced that is of no particular value in a book of this nature; but on the whole he has acquitted himself of the difficult task with credit.

The Pharmacy Handbook. By F. W. Crossley-Holland, F.C.S. Cloth. Price, $2. Pp. 224. New York: Oxford University Press, 1914.

The chief aim of this book is to present ready reference to information on matters which come within the purview of the practicing pharmacist. It is not a systematic treatise on pharmacy, but includes such incidental matters as the relations of the pharmacist to the physician, the trend of therapeutics, facts with reference to the newer therapeutic remedies, some of the principles of dietetics, etc. A special chapter is given to bacteriology, another to incompatibility and one to the ethics of pharmacy. In this chapter the author discusses the ownership of the prescription in which he states that custom and the patient have settled the matter, and the prescription seems unquestionably to belong to the patient. On the other hand, he states that the pharmacists's copy belongs to the pharmacist alone.

The Feces of Children and Adults. Their Examination and Diagnostic Significance with Indications for Treatment. By P. J. Cammidge, M.D. Cloth. Price, $5 net. Pp. 516, with 109 illustrations. New York: William Wood & Co., 1914.

This new book of Cammidge makes extensive use of Hecht's "Die Faeces des Säuglings und des Kindes" as well as of Schmidt and Strasburger's "Die Faeces des Menschen," although much original matter is also included. The practical part of the book follows as far as possible the sequence in which routine examinations are usually made, namely, macroscopic examination, microscopic examination for general food and other residues, parasites and their ova, as well as for various bacteria, and, lastly, the chemical examination. Chapter IX, dealing with the diagnostic value of examinations of the feces, is especially valuable and worthy of mention. Chapter X discusses the indications for the treatment of abnormalities found. The subject-matter is well selected and arranged; the text is clear and concise; the methods of examination are the most satisfactory at our disposal. The illustrations are excellent. Cammidge rightly points out that "it is essential, for the greatest advantage to accrue to the patient, that the pathologist should be aware of the clinical signs and symptoms, so that he may arrange his investigations accordingly." The results of these investigations should be interpreted by the examiner only in consultation with the clinician. This book may be regarded as he most authoritative in the English language and should to the more frequent examination of the feces as well a better understanding of such examinations when made. earnestly recommend this book to all practitioners, especially to those who may wish to have their fecal examinations made by others and who may desire a fuller knowledge of the proper interpretation of such examinations.

Pathogenic Micro-Organisms. A Practical Manual for Students, Physicians and Health Officers. By William Hallock Park, M.D., Professor of Bacteriology, University and Bellevue Hospital Medical College, and Anna W. Williams, M.D., Assistant Director of the Bureau of Laboratories, New York. Fifth Edition. Cloth. Price, $4 net. Pp. 684, with 219 illustrations. Philadelphia: Lea & Febiger, 1914.

In this edition of the well-known book of Park and Williams the material has been rearranged in order to bring more closely together all of the pathogenic organisms. Part I deals with the general characteristics and methods of study of all the micro-organisms considered (molds, yeasts, bacteria and protozoa); Part II includes the study of the individual pathogenic organisms, while Part III presents certain practical aspects of the subject under the title "Applied Microbiology." The subject of immunity has been extensively discussed. A new chapter on filterable viruses has been inserted. This is one of the most practical books at the disposal of the general or special worker, although not so extensive as some. The sections on technic are much more exhaustive than are usually found in general works on bacteriology, while the subject-matter is written with direct appeal to the physician and health officer. The enormous practical experience of the writers in the laboratories of the New York Health Department lends strength to the statements given as well as to the selection of methods advocated. The book may be unhesitatingly recommended to all workers who have occasion to resort to bacteriologic methods in their investigations.

Morris' Human Anatomy. A Complete Systematic Treatise by English and American Authors. Edited by C. M. Jackson, M.S., M.D., Professor of Anatomy, University of Minnesota. Fifth edition. Cloth. Price, $6 net. Pp. 1539, with 1,182 illustrations. Philadelphia. P. Blakiston's Son & Co., 1914.

This edition of this standard work includes many new illustrations and a few changes in arrangement. There is a good thumb index, which aids in the usefulness of such large books as our modern anatomies have come to be. An interesting feature is the reproduction of serial roentgenograms of the stomach. Needless to state, the Basle anatomic nomenclature is used throughout, the previous edition of this book being the first general text-book in anatomy in English to adopt the now generally used terminology.

A Text-Book of Physiological Chemistry. By Olof Hammarsten, Emeritus Professor of Medical and Physiological Chemistry in the University of Upsala. With the Collaboration of S. G. Hedin, Professor of Medical and Physiological Chemistry in the University of Upsala. Authorized translation from the Eighth German Edition by John A. Mandel, Sc.D., Professor of Chemistry in the New York University and Bellevue Hospital Medical College. Seventh edition. Cloth. Price, $4 net. Pp. 1026. New York: John Wiley & Sons, 1914.

"At this time, when so many new and important biochemical facts are being published and when so many older theories and deductions are found more or less erroneous, due to recent investigations using new methods," it is very fortunate that we have been given this complete and critical compilation by Professor Hammarsten. In the work of revision, Professor Hedin has aided considerably by taking care of many of the chapters dealing with subjects with which his own work has been closely identified. This work does not lend itself to a close review, as the subject-matter is too extensive and too diversified. The work stands as the most authoritative one on this subject, so that we must thank Professor Mandel for his careful and excellent translation. The book is recommended both to the student and the advanced worker as a mine of information on the various phases of physiologic chemistry.

A Manual of Bacteriology, Clinical and Applied. By R. Tanner Hewlett, M.D., F.R.C.P., D.P.H., Professor of Bacteriology in the University of London. Fifth edition. Cloth. Price, $4.50. Pp. 668, with illustrations. St. Louis: C. V. Mosby Company, 1914.

The text in this edition of Hewlett's book has been revised, and many alterations and additions have been made in the preliminary chapters dealing with the structure and classification of micro-organisms and with the methods of cultivation, isolation and staining. The portions treating of the specific organisms have, for the most part, been enlarged, while much new matter dealing with the protozoa has been inserted. The theoretical parts of the book have been considerably augmented. The text is clear and concise; the subject-matter is well selected; the methods of diagnosis, while not exhaustive, are adequate for general work, and the general make-up of the work is satisfactory. The book is to be recommended to the student as well as to the general practitioner who may wish to become more familiar with this field of medical science.

A Practical Medical Dictionary of Words Used in Medicine. With Their Derivation and Pronunciation, Including Dental, Veterinary, Chemical, Botanical, Electrical, Life Insurance and Other Special Terms; Anatomical Tables of the Titles in General Use and Those Sanctioned by the Basle Anatomical Convention; Pharmaceutical Preparations, Official in the U. S. and British Pharmacopeias and Contained in the National Formulary; Chemical and Therapeutic Information as to Mineral Springs of America and Europe and Comprehensive Lists of Synonyms. By Thomas Lathrop Stedman, A.M., M.D. Third edition. Leather. Price, $5 net. Pp. 1057, with illustrations. New York: William Wood & Co., 1914.

This edition is larger by thirty pages than the previous one, and new plates have been made for the whole book. It has been brought up to date by the incorporation of a large number of new terms which have come into medical literature since the former issue.

Heredity and Sex. By Thomas Hunt Morgan, Ph.D., Professor of Experimental Zoology, Columbia University. Cloth. Price, $1.75 net. Pp. 282, with 121 illustrations. New York: Columbia University Press, 1913.

This book consists of the Columbia University Jesup Lectures for 1913. The newest researches are included, and the author correlates the study of heredity with the study of the changes in the germ cell. The work includes chapters on the evolution of sex; mechanism of sex determination; Mendelian principles; secondary sexual characters; effects of castration and transplantation; gynandromorphism, hermaphroditism, parthenogenesis and sex; fertility and special cases of sex inheritance. There is a well-chosen bibliography to complete a book which is succinct, nicely printed and well illustrated.

The Infant—Nutrition and Management. By Eric Pritchard, M. A., M.D., M.R.C.P., Physician to the Queen's Hospital for Children, London. Cloth. Price, $1 net. Pp. 265. New York: Longmans, Green & Co., 1914.

The author has here collected lectures delivered at sundry times and places on such subjects as the establishment of lactation and management of breast feeding, physiologic principles concerned in the nutrition and the quantitative food requirements of infants, training of the nerve centers, constipation and its treatment with petrolatum, convulsions, rickets, etc. It fairly well covers the general principles of the subject, and in a way that in many instances is quite at variance with orthodox views. As a book it has the defects of the diffuse style of the lecture and many repetitions, for which the author makes apology.

JOURNALS INDEXED IN THE CURRENT MEDICAL LITERATURE DEPARTMENT JULY-DECEMBER, 1914

The following journals have been indexed in the Current Literature Department of THE JOURNAL during the past six months. Any of the foreign journals, except those starred, will be lent by THE JOURNAL to subscribers in the United States and to Fellows of the American Medical Association for a period not exceeding three days. *Only one journal may be borrowed at a time.* Requests for periodicals should be addressed to the Library of the American Medical Association and six cents in stamps should be enclosed. This covers the average expense of mailing a journal. Domestic journals can be obtained by sending the approximate amount direct to the respective publishers. Thus most of the journals indexed are accessible to the general practitioner, no matter where he may be located.

Albany Medical Annals. M. $2 170 Washington Ave., Albany, N. Y.
American Journal of Anatomy. Bi-m. $5. 36th St. and Woodland Ave., Philadelphia.
American Journal of Diseases of Children. M. $3. American Medical Association, 535 N. Dearborn St., Chicago.
American Journal of Insanity. Q. $5. Johns Hopkins Press, Baltimore.
American Journal of the Medical Sciences. M. $5. Lea & Febiger, 706 Sansom St., Philadelphia.
American Journal of Obstetrics and Diseases of Women and Children. M. $5. Wood & Co., 51 Fifth Ave., New York City.

EXPLANATION OF THE USE OF THE INDEX

This is an index not only to the reading matter in THE JOURNAL, but also to original articles in the principal medical periodicals of this and other countries. The reading matter appearing in THE JOURNAL is distinguished by the use of **black-faced numerals.**

The letters used to explain in which department the matter indexed appears are as follows: "E," Editorial; "C," Correspondence; "T," Therapeutics; "Ml," Medicolegal; "P," Propaganda for Reform; "ME," Medical Economics; "ab," abstract; the star (*) indicates an "Original Article" in THE JOURNAL.

This is a subject index and one should, therefore, look for the chief word, with the following exceptions: "Deaths" and "Society Proceedings" are indexed under these titles at the end of the letters "D" and "S." Matter pertaining to the Association is indexed under "American Medical Association."

All matter is indexed under the most important word of the heading used in THE JOURNAL, and also under the subject heading. For instance, abscess of the brain will be found under "abscess," as well as under "brain." Such titles as "ocular manifestations, etc." have been indexed under "Eye." Cross references have been liberally used.

The figures in parentheses refer to the paragraph, the number following to the page in THE JOURNAL.

ABDOMEN, gunshot wound of, with rupture of pregnant uterus, ***243**

This reference is to an original article in THE JOURNAL, as shown both by the star and by the black-faced numerals indicating the page.

ACID, fruit, and blood, **420**

This reference, as indicated by the black-faced figures, is also in THE JOURNAL, and on turning to page 420 we find an answer to a question in the Department of Queries and Minor Notes.

HERNIA, diaphragmatic, (125) **1234**

In this reference, the (125) indicates that the article is in the Current Literature Department and the fact that the page number is in black-faced type shows that the article is abstracted and discussed in THE JOURNAL. Turning to page 1234 we find (125) refers to an article by S. McGuire in the *Southern Medical Journal,* September.

ACETONEMIA, periodical vomiting with, (87) 813

The fact that in this last reference the page is given in ordinary type indicates that only the title of the article is given. Turning to page 813 we find that the numeral (87) refers to a paper on that subject by G. Hilliger which appeared in *Jahrbuch für Kinderheilkunde,* July.

In the AUTHOR'S INDEX are the names of the authors of articles which have appeared in THE JOURNAL of the American Medical Association and of articles that have been listed from week to week in the Department of Current Medical Literature as having appeared in other journals. The black-faced numerals indicate that the article is in THE JOURNAL, either in full or in abstract. The star (*) preceding the page number, indicates an original article.

SUBJECT INDEX

A

ABATTOIRS, public, (114). 1139
ABBOTT'S frame for applying scoliosis jackets, modification of, (123) 510

  subcutaneous medication in, (132) 431
  treatment, (170) 361
  tuberculous, reaction of bone marrow in, (20) 1141
ANENCEPHALIA, etiology, (19) 58
ANESTHESIA, (36) 2076
  acapnia, surgery and, (58) 352
  acidity, alkalinity and, 2069—ab
  adrenalin-cocain surface, (97) 1507
  anesthetizer, surgeon and, (31) 196
  apparatus for, sterilization of, 1596—C
  brachial plexus, (45) 197
  chloroform, by intratracheal insufflation, (30) 2165
  chloroform, heart fibrillation and, (11) 1427
  dangers of, experiments defining, (83) 1056
  ether, (93) 62, (92) 1233
  ether and chloroform, effects of, on protein contents of blood serum of rabbits, (93) 970
  ether and oil for rectal, (77) 607, (45) 1325, (92) 1425
  ether, by intratracheal insufflation, (31) 2165

ACCIDENT, industrial, to hasten recovery after, (262) 364
  insurance, compulsory, for university students, 1866
  psychologic aspects of relation of divorce, crime and, to mental defects, (87) 275
  railroad, cases, neurologic and psychiatric aspects of, (113) 1698
  railroad, loss of life due to, 872—E
  to unsuitably employed epileptics, 1971
ACETABULUM, epiphyseal diastasis in, (125) 1421
  fracture of, and dislocation of head of femur, mechanism of delivery with, (90) 2080
ACETONE, *acetonuria and acidosis*, (96) 1982
  substances, metabolic relationships of, (42) 606
CETONEMIA, periodical vomiting with, (87) 813
ACETONURIA, acidosis and acetone, (96) 1982
  after spinal anesthesia, (95) 1333
  with acute retrobulbar neuritis, *27
ACETYLCHOLIN and ergot preparations, 2136—E
ACHONDRODYSTROPHIA fetalis, (26) 59
  fetalis, dwarf growth from, (119) 2082
  fetalis, early appearance of centers of ossification and calcification in, (91) 813
ACHONDROPLASIA, (171) 439
  and fragilitas ossium, *1996
ACHYLIA gastrica, diastatic ferment in feces in certain diseases of pancreas in, (25) 705
  gastrica, organic and functional, (85) 358
ACID, *acetyl-salicylic, in asthma*, (110) 1334
  aliphatic, saturated, purification and melting points of, (74) 969
  amino, and hydroxy acids, formation of, from glyoxals in animal organism, (61) 60
  amino, *importance of liver in urea formation from*, (46) 605
  betaoxybutyric, pathologic accumulation of, in the body, 35—E
  boric, poisoning from dressings of, 593
  Carbolic: See Phenol
  cerebronic, (85) 970
  chondroitin-sulphuric, (69) 61
  chromic, for plantar warts, 262—C
  citric, formation of glucose from, in diabetes mellitus and phlorhizin glycosuria, (68) 61
  diacetic and b-oxybutyric, and acetone in urine, turbidity test for, (43) 605
  diacetic, test for, in urine, and of degree of acidosis in diabetics, (124) 520
  fruit, and blood, 420
  glycuronic, significance of, 1857—E
  hippuric, synthesis and rate of elimination of, after benzoate ingestion in man, (39) 606
  hydrochloric, formation of, in foveolae and on surface of gastric mucous membrane, 505—ab
  Intoxication: See Acidosis
  lactic, and sugar, behavior of, in blood, (72) 970
  lactic, and sugar content of blood, *influence of muscular exercise on*, (94) 203
  lactic, and sugar content of blood, test for, (35) 65
  lactic, elimination in urine and connection with carbohydrate metabolism, (216) 362
  lactic, ferments, vaccines and *serobacterins*, 1223
  lactic, in urine in cyclic vomiting in children, (3) 887
  lignoceric, constitution of, (85) 970
  nitro-muriatic, for boils and skin infections, (101) 353
  nucleic, analysis of effect of nuclein and, on normal antibody, (21) 1985
  nucleic, synthesis of, (73) 1887
  nucleic, test, in blood diseases, (129) 360
  phosphoric, inorganic salts of lime and, nutrient value of, 581—E
ACID, phosphoric, organic, compound of wheat bran, (70, 71) 970
  picric, in pellagra, 1598—ab
  production of, by bacillus coli group, (95) 2162
  Salicylic: See also Salicylates
  stains, vital staining with, (54) 1885
  sulphuric, conjugated, from tendomucoid, (41) 605
  sulphuric, in pyorrhea alveolaris and furunculosis, (88) 275
  trichloracetic, in lupus vulgaris, *1352
  uric, cholesterin and sugar in blood, quantitative estimation of, (70) 509
  uric, color test for, in urine, (117) 714
  uric, content of blood, (43) 2072
  uric, content of blood in diagnosis, (86) 435
  uric, diathesis, lithium salts in, 184
  uric, overproduction, (66) 197
  uric, protein intake and formation of, (80) 970
  volatile fatty, relation to disturbance in metabolism in intestine of normal infants and those with gastro-intestinal disturbances, (227) 363
ACIDITY, alkalinity and anesthesia, 2069—ab
  of fresh cow's milk, cause of, and method for determining, (65) 1232
  of gastric juice in man, 580—E
ACIDOSIS, acetone and acetonuria, (96) 1982
  acute, 1296—T
  blood in, from quantitative point of view, *397, (79) 970
  chronic myocardial disease terminated by, (8) 200
  determination of, and clinical availability in diabetes, (112) 70
  diabetic, estimation of, by determination of carbon-dioxid tension in air in lungs, (111) 70
  diabetic, unique case of, 2297—E
  in kidney and heart disease, (43) 968
  in omnivora and herbivora and relation to protein shortage, (17) 2259
  kidney lesions of cholera and, (4) 1053
  respiration in, *318
  test for diacetic acid in urine and of degree of, in diabetics, (124) 520
ACNE rosacea, roentgenotherapy of keratitis from, (97) 1243
  Swiss sulphur mineral water in eczema and, (34) 1141
  vaccine, 1204, 1479
ACOUSTIC nerve tumor, 6 operative cases, (82) 1797
  reflexes in decerebrate cat, (20) 2070
ACROMEGALY, (22) 200
  and splanchnomegaly with hypophysis tumor *in male cadaver* of thirty-two, (36) 1141
  glycosuria induced in dog by intravenous injection of cerebrospinal fluid from patient with, (67) 434
  metabolism in, (35) 1135
  tabes and, (125) 2170
ACTINOMYCES, cladothrix, and streptothrix, differentiation of, (68) 1511
ACTINOMYCOSIS, (59) 1885
  lung, primary, in child of ten, (1) 887
  shoulder, exarticulation for, (79) 202
  with metastases, (40) 1330
ADAMS - STOKES Disease: See Heart-Block
ADDISON'S DISEASE aggravated by ascaris lumbricoides and hysteria, (20) 1236

BEANS, advantages of dried peas and, in diabetes, (45) 811
  for prevention of pellagra, 1314—C
BEARD, ringworm of scalp and, (31) 895
BECK'S paste, 698
BED for advanced heart disease, (71) 281
  position of, in relation to magnetic meridian, rotation of earth, etc., (111) 1064
BEE and ant as carriers of pathogenic micro-organisms, (17) 1324
  stings and anaphylaxis, (30) 1793
BEEF, fat in, no basis for prejudice of public against high color of, used as food, 1210—E
BEHRING and Metchnikoff, 2144
  diphtheria inoculation, effectual, (65) 812, (10) 887
BELGIAN colleagues, aid for our, 2144
  physicians and surgeons, aid to, 2240
  physicians, funds required for, 1866
  physicians, privileges for, 1967
  refugees, 1590
  refugees, dispensary for, 1966
  students, aid for, 1868
  wounded in England, 1966
BELL, Charles, artistic qualities of, (39) 59
BENCE-JONES protein in urine, origin of, 1481—E
  proteinuria, metabolism in, (45) 605
BENDER hygienic laboratory, (3) 58
BENZOATE, synthesis and rate of elimination of hippuric acid after ingestion of, in man, (39) 606
BENZOL, biologic action of selenium, tellurium, thorium and, (38) 2312
  in leukemia, *143, (196, 198) 440, (98) 2074
  poisoning, blood findings in acute and chronic, (121) 2170
BENZOYL, carbinol and other substances, formation of, from phenyl glyoxal by action of fermenting yeast, (65) 61
BERANECK'S tuberculin in tuberculosis, 4 cases, (13) 2165
BERGONIE'S method of electro-gymnastics, (113) 1334
BERIBERI, *1287, (13) 1695
  etiology of, and milled rice, (9) 807
  experimental study of, (12) 1984
  heart in, orthodiagraphic examination, (34) 355
  in Papua, (27) 1884
  influence of fuel value of dietary on quantity of vitamin to prevent, (10) 278
  pathologic affinities of scurvy and, *1290
  pathologic-histologic findings in nervous system with, (78) 1145
BERKEFELD filter, effect of filtration through, on coagulability of oxalated plasma, (19) 1604
BERLIN letter, 45, 177, 255, 335, 415, 496, 593, 878, 959, 1044, 1217, 2056, 2145, 2242
  public health board proposed for, 415
BERTRAND'S method for determining blood-sugar compared with Bang's micromethod, (16) 605
BETUL-OL refused recognition by Council, 2148—P
BICEPS, rupture of tendon of long head of, (107) 282
BIG SIX, nostrum advertising in, 1594—P
BILE culture medium for Malta fever germs, (163) 438
  duct, atresia of, congenital, (16) 1058
  duct, calculi in common, transduodenal and retroduodenal choledochotomy, (38) 279
  duct, cancer of common, diagnosis of, (33) 2160
  duct, deformity of, (56) 1060
  duct infection, complications and end-results, (78) 61
  pigment in urine with hemolytic jaundice, (13) 2261
  pigment, sand test for hemoglobin in urine and, (58) 1613
  pigments, urochromogen reaction influenced by heat and, (156) 206
  retention from functional incapacity of liver, (62) 356, (68) 434
  salts in blood, influence of, on vascularization of organs, (91) 1145
  tract, echinococcosis of liver perforating into, operative treatment, (59) 434
  tract, hydrops of, (152) 438
  tract in cholera, (2) 1983
  tract, pancreas disturbance secondary to disease of stomach or, (109) 204
  tract, relation of liver to operations on stomach and, (73) 509
  tract surgery, (18) 2070, (3) 2309
BILHARZIA disease, case of, (13) 64
BILLFINGER, Dr., conviction of, 593
BINET-SIMON test, use and value of, *319
BINGHAMTON, newspapers and book-store proprietors, attitude of, toward "The Clarion," by S. H. Adams, 2049—E, 2062—C
BIOLOGIC therapy and public health, (16) 1420
BIOLOGY, periodicity in, (34) 1060
BIRTH and death rates, 2133—ab
  certificate, value of, (118) 608
  dislocation of lower femoral epiphysis, (29) 1231
  paralysis, unusual form of, *2282
  rate, French, latest diminution in, 255
BISCUITS, flour moth in soldiers', (7) 1699
BISMUTH meal and Roentgen-ray method in diagnosis of gastro-intestinal disease, (16) 894
  passes into bronchi through perforation in cancer of esophagus, (58) 1987
  roentgenography and test-meal, technic of, (40) 1566
BLACKWATER FEVER, (89) 1791
  in southern Rhodesia, (114) 1234
BLADDER calculi, (71) 353
  cancer, (21) 1920
  cancer at base of, diathermy for, (41) 279
  cancer, extensive operation in, *2266
  cancer, radium therapy in, *1852
  changes following suprapubic prostatectomy, (101) 2169
  displacement of uterus, rectum and, end-results after 109 operations, (9) 2070
  diverticula of urinary, *2015
BLADDER drainage, simple method of, (112) 276
  exstrophy, (52) 197
  exstrophy, operative treatment of, (164) 361, (103) 436
  exstrophy, ureters grafted into rectum in, (4) 199
  foreign bodies in, *656
  gunshot wound of, (91) 1697
  hematuria from varices in, (169) 438
  hernia, 3 cases, (43) 611
  irrigation of kidney pelvis and, two-way retention catheter for, (97) 813
  operations, endovesical, simplification of, (86) 979
  papilloma, high-frequency destruction in, (39) 1422 (11) 2165
  perforation of, from chronic ulceration, with secondary appendicitis, (36) 894
  restoration of, (40) 811
  roentgenograms of, (62) 1431
  rubber drainage-tube in, *656
  rupture of, (7) 2309
  rupture of, extraperitoneal, surgical treatment, *2114
  rupture of, intraperitoneal, (10) 1139
  rupture of, with fracture of pelvis, (108) 1057
  sphincter, insufficiency of, in women, (101) 713
  syphilis, (39) 810
  transposition of uterus and, (85) 1056
  transposition of uterus and, for cure of rectocele and prolapse of uterus, (62) 969
  tuberculosis, cystoscopy with, (82) 281
  tuberculosis, exclusion of, in severe, (104) 1990
  tuberculosis, phenol instillation in, (91) 1138
  tumors, (122) 1698
  tumors, high-frequency current in, (79, 84) 281, (36) 1510
  tumors, instrument for direct application of radium in, (104) 429
  tumors, malignant, excision of, (3) 199
  tumors, operative treatment, (56) 2077
  tumors, radical extirpation of, technic for, (116) 510
  urinary, methods of invasion, (30) 509
  urinary, self-retaining, collapsible, T-shaped catheter for suprapubic drainage of, *1031
  wounds, shell, (36) 2311
BLAIZOT'S and Nicolle vaccine in gonorrhea, (5) 2164
BLASTOMYCOSIS, systemic, fatal, 2 cases of, (24) 350
BLAUD'S pills, keeping quality of, 1315
BLEPHAROPLASTY by pregrafted flap, (37) 350
BLIND and seeing subjects, comparative study of, (62) 1880
  Illinois school for, with record of causes of blindness, (58) 1325
BLINDNESS: See also Ophthalmia Neonatorum
BLINDNESS, causes of, in 1109 children, (5) 1139
  color, examination for, by lantern tests, (65) 1056
  color, inheritance of, (102) 1064
  from atoxyl, (110) 282, (26) 2262
  mastoiditis, latent, complicated by cerebral symptoms, streptococcemia and, (27) 1420
BLOOD, acid content of, increased in uremia, (81) 517
  action of roentgenized serum on, (63) 1430
  advances in knowledge of circulation and, since Harvey's time, (28) 1884, (32) 1985
  albumin content of, in tuberculous children, (223) 363
  alkaline reaction of, efforts of organism to maintain normal, (85) 68
  alterations in, in hay-fever, (3) 64
  ammonia content of, effect of acute destructive lesions of liver on its efficiency in reduction of, (67) 970
  ammonia, rate of disappearance in, in normal and thyroidectomized animals, (30) 605
  bacillus mucosus in, in purpura, (35) 805
  bacteria in circulating, in rabbits, estimating, (37) 1136
BLOOD, bile salts in, influence of on vascularization of organs, (91) 1145
  caisson-work and action of, (100) 1990
  calcium content of, (173) 285
  calcium removed from, by dialysis in study of tetany, (75) 891
  carbon monoxid in, potassium iodid test for, (129) 1890
  changes in, during labor, lactation and first menses, (62) 812
  cholesterin content of, in diagnosis of cholelithiasis, *146
  cholesterin in, and resisting power of red corpuscles in anemic conditions, (123) 1706
  circulating, of living animals, removal of diffusible substances from, by dialysis, (97) 970
  clotting of, seen with ultra-microscope, (29) 889
  coagulability, in young infants, (138) 283
  coagulation and fat acids, (40) 1142
  coagulation and sugar solution, 1226—ab
  coagulation, fibrin as factor in, (122) 616
  coagulation time of, (12) 273, (109) 1234
  coagulation time of, in epilepsy, (69) 1880
  complement in, variation of amount of, in acute infectious diseases and clinical features, (18) 1984
  composition of, and constitution of child's body in relation to nutrition and weight, (67) 1988
  corpuscles in paratyphoid and after vaccination with bacillus typhosus, (43) 1605
  corpuscles, lipoid substances in, (151) 206
  corpuscles of vertebrates, structural transformations of, (26) 1504
  corpuscles, origin of, and differentiation of leukocytes, (81) 1507
  corpuscles, plasma removal with return of, (98) 970
  corpuscles, red, basic staining of, (165) 438
  corpuscles, red, cholesterin and resisting power of, (118) 1889
  corpuscles, red, color-index of, (13) 604
  corpuscles, red, elliptical human, (53) 1423
  corpuscles, red, fragility of, in physiologic and pathologic states, (43) 433, (46) 710
  corpuscles, red, proteolytic ferments contained in, 488—E
  corpuscles, resistance of, to hemolysis by saponin, (19) 1059
  corpuscles, total red and white, and hemoglobin and color-index estimation, (83) 1597
  Corpuscles, White: See Leukocytes
  count apparatus, modified technic for, (113) 70
  cytology of, in passive immunity, (8) 1058
  destruction and regeneration, relation of spleen to hemolytic jaundice and to, (52) 428, (71) 890
  determination of varieties of man, 883
  diseases, drug treatment of, (152) 284
  diseases, nucleinic acid test in diagnosis in, (129) 360
  diseases, roentgenotherapy in, (61) 518
  diseases, treatment, present status of, (83) 614
  distribution of, and physical and chemical measures, (72) 516
  distribution of, during stimulation of splanchnic nerve, (18) 888
  dust in diagnosis of liver disease, (94) 510
  dust in infants' serum, (59) 202
  epinephrin in, of children, (125) 1706
  examination in malaria, plea for, (145) 1328
  extravasated, vasoconstricting properties of, (25) 514
  fat content of, 2074—E
  fat content of, variations in, under normal conditions, (59) 1232
  fat-lipoid content increased in pregnancy, 1299—E
  flow, carotid, and intra-abdominal pressure, (7) 2258

CANCER, appendix, (46) 197
  autolysates of, embryonal or cancer tissue in, (98) 980
  Bartholin's gland, primary, 517
  bile duct, common, diagnosis of, (33) 2160
  biologic tests for diagnosis of, (97) 980
  bladder, (21) 1980
  bladder, diathermy for, (41) 279
  bladder, plea for extensive operation in, *2266
  bladder, radium therapy in, *1852
  breast, (91) 62, (130) 63, (123) 198, (53) 275, 878—ab, (64) 1606
  breast, diagnosis of, (83) 892
  breast, recurrent, disappearance after removal of ovaries, (29) 1605
  breast, Rodman operation for, *1256
  breast, treatment of recurrences and metastases from, (5) 2075
  cardia, advantages of resection from rear, (126) 71
  cecum, (46) 197, (78) 1791
  cells, cultivation of, in vitro, 191—ab
  chemotherapy of, 33—E, (257) 364, (69) 613
  colectomy for, (41) 611
  colectomy for, technic for exteriorization for, (47) 612
  colon, intestine obstruction due to, (144) 1608
  De Keating-Hart's method of fulguration and thermoradiotherapy in, (22) 1700
  diagnosis, (12) 58, (39) 967, (40) 2160
  diagnosis and treatment, (76) 1062
  diagnosis, early, and prevention of, (130) 1234
  diagnosis from cells found in stomach content, (66) 434
  diet and, (11) 1698
  disappears after intercurrent erysipelas, (90) 1798
  duodenum and small intestine, (7, 24) 1793
  duodenum resection with papilla for, (63) 1331
  ear, 3 cases, (100) 1514
  electrical treatment of, 192—ab, (107) 1327
  esophagus, bismuth passes into bronchi through perforation in, (58) 1987
  esophagus, lower, operation for, (45) 1061
  esophagus, resection of cardial section for, (57) 1144
  etiology of, 879—ab
  experimental, (135) 616
  fallopian tube, primary, (17) 1504
  frequency of, in man and tumor in plant and animal life, 1502—ab, (87) 1697
  growth of, in mouse, influence of various substances on, (47) 1789
  hand, after battle wound, (45) 1330
  heredity and, 1480—E
  histology of, 879—ab
  histology of, after radiotherapy, (51) 1239
  immunity by radium irradiated mouse cancer, (32) 279
  in Netherlands, (98) 1063
  in old age, factors in disposition of, (130) 1882
  incidence of, (136) 512
  intestine, large, in young people, (31) 611

CARDIORENAL Diseases: See Heart and Kidney Diseases
CARDIOSPASM, (53) 352
  improvement in method of dilatation and apparatus, *2131
CARDIOVASCULAR disease and seashore, (35) 1142
  disease, pains in, (106) 1327
  disease, pathogenesis and treatment of, (129) 616
  disease, therapy of, *311
  diseases, indigestion forerunner of cardiorenal and, (111) 2075
  syphilis, (15) 1135
  system, behavior under physicotherapy, (129) 436
CARDITIS, acute rheumatic, auricular flutter in, (1) 893
  acute rheumatic, heart block in, (7) 2310
CARDUI, Wine of, 258—P, 961—P
  endorsed by Holston Conference of Methodist Church, 2058—P
  Wine of, libel suit against A. M. A., 961—P, 1038—E
  Wine of, still soliciting testimonials, 1313—P
CARIES, dental, and internal secretions, (4) 354
CARMIN, feces marked off by, (80) 357
CARNOSIN in meat, 489—E
CAROTID blood-flow and intra-abdominal pressure, (7) 2258
  tumors of, (134) 63, (136) 431
CAROTIN and xanthophylls, fate of, in body, 1304—E
CARRIERS, ants and bees, of pathogenic micro-organisms, (17) 1324
  bacillus, (7) 974
  bacillus, among animals, 248—E
  diphtheria, (82) 1063
  diphtheria, chronic, vaccine therapy for, (108) 1698, (94) 1982
  diphtheria, treatment of, (43) 509
  dysentery in Sarawak, (13) 609
  flies as, of disease, 1674—E
  germ, at sanatoriums and spas, (173) 361
  malaria, 2158—ab
  oxyuris vermicularis as, (102) 1327
  typhoid, (115) 359, 1860—E
  typhoid, and institutional epidemics, (31) 2260
  typhoid from, through milk, (124) 1139, (5) 1420
  typhoid, 93 persons infected by, at public dinner, *1537
  typhoid vaccine and, 420
CARRION, monument to, 333
CARROTS, yellow skin after eating raw scraped, (103) 1146
CARTILAGE, regeneration of bone and, (127) 1882
CASE histories, publication of, and professional secrecy, 592
CASEIN, 1128—P
  Abderhalden's dialysis test applied with, (82) 517
  action of rennin on, (16) 2259
  commercial, feeding value of sanatogen and, *1831
  in infant-feeding, (2) 887
  phosphorus content of, (64) 1232
  splitting ferments, (61) 2167
CASTRATION: See *also* Sterilization
CASTRATION, nervous and mental disturbances in women following, *1345
  sympathetic irritability lowered by, 1860—E
CATARACT, diagnosis of senile, chronic glaucoma and atrophy of optic nerve, (72) 1797
  extracapsular extraction of, irrigation after, (10) 354
  extraction, clear pupil after, (24) 1700
  extraction, complications in, (31) 1980
  extraction of immature, following preliminary capsulotomy, *851
  extraction, in capsule, notes on 1,137 operations, (9) 354

CATARACT extraction, present status of, (69) 509
far-sightedness, long-sightedness and causes of, (64) 1056
incipient, subconjunctival injections of mercuric cyanid in, 1603—ab
mechanism of development of presbyopia and, (55) 1430
operations at Shikarpur, 1,000 performed in 6 weeks, (8) 354
operations, choice of, (7) 1139
operations, double, (112) 1426
polar, (157) 72
senile cortical, similar to cataracta complicta, (139) 431
treatment of earlier stages of senile, (136) 1608
CATARRH, deafness due to, physiologic treatment of, (109) 354
intestinal, in children, chronic, treatment of, (75) 1432
of apex of lung, examination for, (46) 1510
of uterus cervix, induced by gonorrheal threads free from gonococci, (44) 1510
CATATONIA, hemiatrophy of cerebellum in, (60) 1326
CATGUT splints, woven, for open treatment of fractures, (89) 1057
CATHETER, self-retaining, collapsible, T-shaped, for suprapubic drainage of urinary bladder, *1031
two-way retention, for continuous irrigation of bladder and kidney pelvis, (97) 813
CATHETERIZATION, ureteral, and hematurias, (104) 1507
CAUTERY in ulcer of stomach, (155) 1609
CAVERNOUS plexus, gunshot wound of, (157) 1699
CECO-SIGMOIDOSCOPY for Hirschberg's disease, (116) 2075
CECUM and chronic disorders in right lower abdomen, (85) 2074
cancer of appendix and, (46) 197, (78) 1791
chronic inflammation of, and pericolitis, (59) 1060
cyst of, causing intestinal obstruction in infant, (5) 277
diagnosis and treatment of disease of, 270—ab
disease of appendix, sigmoid flexure and, (76) 711
diseased condition of, (84) 1791
movable, torsion of colon, ileus and, (30) 1141
operations, disturbance after, (119) 436
perforation with ileus in lower intestines, 2 cases, (138) 360
undescended, (33) 976
CEDAR poisoning, 1872
CELERINA, 1411
CELL, action of radiations on fluids and, (10) 1883
effect of tissue extracts on, growth of adult mammalian, in vitro, (21) 2259
proliferation of connective tissue, effect of variation in osmotic tension and of dilution of culture media on, (73) 890
CELLI, Angelo, death of, 2053
CELLULITIS, orbital, treatment of, (67) 1790
CELLULOID splints in diseases of nervous system, (37) 709, *773
CENSUS of Paris, definite results of, 1310
CENTRIFUGAL separator with automatic self-cleansing mechanism, continuous type of, (34) 278
CENTROSCOPE, roentgenographic episcope and, (31) 2076
CEREBELLUM abscess, (33) 1421
abscess, diagnosis and treatment, (10) 2164
abscess with atypical symptoms, (21) 273
angioma in peduncle, fatal intracranial hemorrhage, (42) 279
artery, posterior inferior, occlusion of, *1550
hemiatrophy of, in cantatonia, (60) 1326
labyrinth and, (48) 1880
Purkinje cells in, method of counting, 10 clinical cases, (24) 2260
surgery, (54) 275
symptoms and localization of, including kinematographic observations on cerebellar phenomena, *1813
syndrome of Babinski, (56) 1981
CEREBRAL embolism, traumatic paradoxic, (77) 2168
CEREBRAL embolism, increased pressure in, in eye diseases, (73) 2080
new facts about, 1037—E
operative treatment of hydrocephalus by diversion of, (37) 1238
origin and circulation of, (15) 1604
potassium content of, in various diseases, (25) 1695
potassium permanganate reaction in pathologic, (119) 205
pressure, measurement of, (65) 434, (45) 515
studies on, (42-48) 1506
CEREBROSPINAL FLUID, 1764—E
absorption of, 1057—E
and its relation to brain tumors, (97) 198
and nervous system in secondary syphilis, (31) 1135
antibody in syphilitic, source of, (146) 437
cell counts in untreated cerebrospinal syphilis, (54) 1981
cerebral, method of mingling remedial agents in, (23) 65
changes in, after injection of neosalvarsan, (105) 713
colloidal gold reaction in, (120) 205, (7) 426, (80, 81) 1881, (100) 2081, 2138—E
drainage of, (43) 1506
dual source of, (45) 1506
examination and rachicentesis in meningitis in children, (25) 513
examinations in cured syphilis, *550
findings and general nervous symptoms early in syphilis, relations between, (198) 362
glycosuria induced in dog by intravenous injection of, from acromegaly patient, (67) 434
in acute nephritis in children, (109) 1888
in intracranial surgery, *287
sources of, 2232—E
CEREBRUM, arteries of, spasmodic closing of, and cerebrum hemorrhage, (2) 1053, (27) 1054
arteriosclerosis of, (141) 1328
atrophy of convolutions, aphasia due to, (5) 1792
cortical connections of red nucleus, (1) 1694
cyst of left hemisphere of, operation for, *1649
cyst without localizing symptoms, (12) 278
electric treatment of diseases of, (1) 1883
fluid in eye and, analogous processes in, (48) 1506
Hemorrhage: See Brain, Hemorrhage
in insanity, increase of total nitrogen and urea nitrogen in, (43) 2072
syphilis in secondary stage, (68) 1137
tuberculosis of crus, simulating enteric fever, (40) 200
tumor of crus, *1662
CERTIFICATE, requirement as to record of, 345—Ml
CERTIFICATION, medical, other than under lunacy acts, (2) 973
CERVICAL RIBS, (96) 892
brachial neuritis and, (48) 197
double, nerve symptoms of, 1976—ab
surgical aspect of, (49) 197
CERVICITIS, gonorrheal, and endometritis, pathology and treatment, (2) 349
CESAREAN SECTION, (25) 1231
abdominal, (115) 608, (32) 1880
abdominal, for contracted pelvis in child of 12, (95) 62
abdominal, for eclampsia, 500 cases of, (1) 349
analysis of 60 cases, (22) 605
classic, 30 cases, (242) 363
extraperitoneal, 5 cases, (23) 1231
extraperitoneal, technic for, (22) 1231
fistula, tardy, (64) 711
for double multilocular ovary cyst, (110) 62
for eclampsia, (123) 1234
for placenta centralis, (83) 607
for pregnancy complicated by morbus cordis, spinal anesthesia in, (15) 64
high forceps and, (46) 1325
high incision in, (56) 2161
impassable contraction of gravid uterus verified by, (120) 198
in primipara with ovarian cyst, (10) 1235
mortality in, (7) 1230
CESAREAN SECTION, pelvic chondrosarcoma and, (13) 887
removal of uterus instead of, in infected cases, (118) 1705
rupture of uterus through scar of old, (7) 1507
third, at term, twins, (66) 711
with hysterectomy under spinal anesthesia following rupture of uterus, (83) 607
CHAGAS' disease, triatoma transmitting, (115) 1889
CHAIR, obstetric, revival of, (27) 1231
CHAMPAGNE, how it is made, 1970
CHAMPETIER DE RIBES bag in obstetrics, use of, (94) 608
CHANCRE, lip, with early involvement of nervous system, (97) [illegible]
salvarsan, and soft, (71) 1511
soft, and primary lesion of syphilis, differentiation, (142) 205
CHAPOTEAUT'S Wine, 2247—P
CHARCOAL in wound dressing, (165) 361
CHARITY, medical, and medical legislation, (66) 707
CHARLOTTENBURG public hospital, special treatment in, 496
CHATTANOOGA Medicine Company, 961—P, 1038—E, 2058—P
CHAULMOOGRA oil mixture for leprosy, (8) 2258
CHEILITIS exfoliativa, (53) 606
CHEILOTOMY, case of, (20) 517
CHEMICALS, patents expiring on certain, 693—E
CHEMOTHERAPY of cancer, 33—E, (257) 364, (69) 613
CHENOPODIUM, oil of, in uncinariasis, 1875—ab, *1946
CHESS players, famous, mental states in, (78) 1881
CHEST: See Thorax
CHESTNUTS, toxemia due to, *30
CHEYNE-STOKES breathing, prolonged, case of, (44) 433, (47) 710
CHIASMAL and mean cyclopean images, (102) 608
CHICAGO Journal on "Live stock versus quail," 1959—E
Winfield Tuberculosis Sanatorium, (110) 971
CHICKEN-POX, organism of small-pox, vaccinia and, (72) 605
skin reaction in differentiation of small-pox and, (69) 1702
CHILD Labor, conference on, 2229
labor, progress in legislation against, 1963
life, conservation of, (102) 892
manslaughter in failure of parent to provide for, 2309—Ml
welfare association, Arkansas, (85) 1138
welfare at Museum of Hygiene, 335
welfare forces, unification of, (98) 608
CHILDBEARING: See Labor
CHILDREN, acidity of stomach contents in infants and, on milk and meat test diets, (103) 814
actinomycosis, lung, primary in child of ten, (1) 887
anaphylaxis and status lymphaticus in relation to intensified types of diseases in infants and, (14) 432, (13) 894

  Austin Flint, mode of production, recognition and importance, (31) 2160
  intracranial, (95) 2169
MURPHY button, improved, (61) 1060
  button, plea for more uniform use of, (15) 887
  method in ankylosis of knee, (32) 65
MUSCLE, abdominal, tonicity of, in typhoid, (43) 1700
  comparative chemistry of, (59) 60
  contraction of, synchronous with heart beat, (72) 1988
  extra-ocular, operations on, (106) 2075
  flaps, pedunculated, plugging cavities in bones with, (54) 976
  flaps to arrest hemorrhage, experimental research on, (71) 357
  flaps to arrest hemorrhage of heart and liver, (74) 357
  hernia of, fascia patch to cure, (22) 975
  hypertonicity of, in new-born infant, (112) 359
  implantation of nerve in, (38) 1237
  implantation of nerve in, and neurotization corrects paralysis of trapezius muscle, (127) 71
  levator ani, suture of, in perineorrhaphy operations, (75) 1056
  metabolic changes in tissue of, (63) 1697
  ocular, external, paralysis of, with lead-poisoning, *403
  ocular, extrinsic, congenital absence of, 421
  ocular, paralysis of, (13) 967, (72) 1702
MUSCLE of hand, leg and diaphragm, localization of function in spinal cord for, (77) 1144
  quadriceps, paralysis of, (32) 1060
  rectus, external, paralysis of, due to abscess in apex of petrous pyramid, death from basal meningitis, (5) 974.
  rectus, external, spontaneous rolling up of eyeball on attempt at adduction with congenital paralysis of, (261) 364
  scapular, spasmodic contraction of, (56) 434
  sign of chronic appendicitis, (90) 1146
  smooth, action of pituitary extract from gravid and non-gravid animals on, (61) 67
  smooth, heat production in, (20) 1605
  thyroid extract, effect of, on voluntary, (8) 426
MUSCULATURE in children with rachitis, histologic examination of, (54) 1987
MUSCULOCUTANEOUS nerve, paralysis of, 2 cases, (79) 2168
MUSEUM for infant hygiene, 46
  jars, sealing of, 597, 796
MUSHROOM poisoning, (18) 427, (136) 2170
MUSIC, salutary effects of, 953—E
MUTATIONS in bacteria, 424—ab
MYASTHENIA, epithelioma of thymus in, (17) 1059
  gravis, (106) 354, *1553, (14) 1793 (97) 2081
  gravis, metabolism studies in case of, (12) 426
  paralytic, versus asthenia from adrenal insufficiency, (75) 281
MYATONIA congenita, (24) 605
  congenita of Oppenheim, (6) 1502
MYCOSIS of lungs, (114) 1889
MYDRIASIS, treatment of, 1495
MYELITIS, acute, with perirectal abscess after severe fright, *1546
MYELOID tissue, abnormal proliferation of, without blood-picture of leukemia, (120) 70
MYELOMA, (94) 2169
MYIASIS, ear, with radical mastoid operation, *479
  intestinal, *321
  rhinal, 2 cases, (87) 1327
  urinary tract, *2285
MYOCARDITIS, gummatous, (139) 2170
MYOCARDIUM function, diagnosis of abnormalities of, (30) 967, (30) 2160
  how to tell whether competent, 349—ab
  insufficiency, chronic, prognosis of, (29) 2160
MYOCLONIAS, (83) 1233
MYOMA and cancer in same uterus, (188) 286
  esophagus and cardia, (109) 70
  pregnancy and, (40) 1238
  uterus, and malignancy, 1417—ab
  uterus, conservative operative treatment of, (64) 202
  uterus, treatment of, (107) 70
  vagina, (63) 67
MYOMECTOMY and resection of uterus in fibroid tumors, 1418—ab, (11) 2070
  pregnancy after, (28) 514
MYOPATHY, (10) 1604
  spinal, progressive, new familial form of, (53) 1981
MYOPIA, biologic variability as factor in, (37) 2166
  heredity in, (6) 1139
MYOSITIS, *1249
  ossificans following trauma, *1452, (62) 1796
MYOTONIA, acquired, (20) 809
  congenita, (27) 1428, (55) 1790
  congenita, metabolism in, (44) 968
MYRINGOTOMY, injury to jugular bulb following, in infant 10 months old, (30) 273
MYXEDEMA: See also Acromegaly, Cretinism; Goiter, Exophthalmic; Infantilism
MYXEDEMA, (108) 2163
  congenital, and thyroid treatment, (97) 713
  graft of monkey's thyroid for, in boy of 14, (30) 810
  roentgenogram, transverse striation in, (228) 363
MYXOSARCOMA, nasopharyngeal, (24) 1420
  or granuloma of hand, (20) 1985

N

NAILS, favus and ringworm of, *640
NAME, pleasant, for hospitals and sanatoriums, 1304—E
NAPHTHALENE for destruction of mosquitoes in covered cisterns and wells, (11) 431
NARCOPHIN, 1872
NASMITH, Dr., to safeguard soldiers' health, 1042
NASOLACRIMAL stenosis, intranasal operation for, (19) 1420
NASOPHARYNGOSCOPE, (51) 279, (107) 1607
NASOPHARYNX, involution of, clinical importance of, (11) 426
  myxosarcoma of, (24) 1420
  polyp in, (60) 356
  shape of cavity, and transverse sinus, (106) 1334
NATIONAL Association for the Study and Education of Exceptional Children meets, 42
  board of medical examiners, 951—E
  Child Labor Committee, meeting of, 2239
  Civic Federation, meeting of, 1964
  defense and medical profession, (55) 1605
  department of health, Gorgas for head of, 1414—ab
  League for Medical Freedom, attack of, on Bureau of Education, 1038—E
  Medical Association meeting, 956
  standard requirement for practice of medicine, 951—E, 1223—C
NATURE, healing power of, (4) 894
NAVAL battle, circular to be distributed before, (65) 1613, (51) 2264
NAVY, health conditions in, 2139—E
  medical service in, (45) 1794
  scuttle butt, suggested improvement of, (106) 1057
NEAL, E. Virgil, a noted quack, 499—P
NEANDERTHAL man, (50) 352
NEBRASKA medical news, 39, 411, 491, 791, 1213, 1864
NECK abscess of otitic origin, (108) 1888
  cystic cancer of, (104) 282
  gunshot wounds of face and, (105) 359
  lipomas of, diffuse, operative treatment, (125) 1890
  lymph glands of, chronic disease of, (89) 1888
  table attachment for surgery on face, throat and, *483
  tumors, (115) 892
  tumors, injury of vagus during removal of, (194) 440, (83) 1145
NECROPSY among Jews, (108) 62
  findings and surgical diagnosis, (129) 1328
  findings at Galveston, (143) 199
NECROSIS, local, following skin tuberculin test, (111) 1243
  pancreas, postoperative, (78) 712
NEEDLE, aneurysm, two-eyed, (94) 1056
  found in physicians' heart, 494
  holder, magnetized, (111) 62
  protruding through wall of stomach, (83) 61
  self-retaining, for administering salvarsan intravenously, *1029
NEGRI bodies, technic for staining, (93) 1145
NEGROES, American, skin diseases in, (76) 1697
  in hospital life, 494
  in south, condition of, (113) 2075
  laundresses, tuberculosis among, (82) 1233
  mental examination of, diagnostic pitfalls in, (99) 198
  psychoses among, (6) 1878, (55) 1981
  public health problem, (135) 199
  syphilis among canal, (127) 1698
  syphilis in American, *463
NEMATODES, bursate, from Indian elephant, (15) 1984
  formula, variation in oxyurias and, (67) 1424
NEOPLASMS: See Tumors
NEOSALVARSAN and salvarsan in hereditary syphilis, (2) 807
  and salvarsan in office practice, (123) 205
  and salvarsan in syphilis, (92) 2074
  and salvarsan, intramuscular and intravenous injections of, in frambesia, (23) 894
  behavior of, (64) 1424
NEOSALVARSAN, complications following intradural injection of, *1851
  concentrated solution of, (94) 198
  death after, (171) 361
  for children, (63) 2078
  in active pulmonary tuberculosis, (31) 200
  in entamebiasis, (122) 430
  in feeblemindedness, (18) 1700
  in progressive paralysis, (142) 72
  in syphilis of nervous system, in light of Wassermann reaction and treatment with, (1) 2164
  in syphilis of nervous system, intradural injections, technic of, *137
  in syphilis of nervous system, intrameningeal injections of, *2287
  in syphilitic keratitis, (34) 810
  intraspinal injections of, (87) 1881
  intravenous injection of concentrated solution of, (92) 1989
  intravenous injections of, experience with, (59) 1325
  intravenous injections of, technic for, (59) 711, (32) 1329
  Los Angeles deaths from intraspinal injections of, (42) 60
  malaria cured by, (107) 1057
  spinal fluid changes after injection of, (105) 713
NEOSALVARSANIZED serum in syphilis of nervous system, (54) 1143
NEPHRECTOMY, changes in other kidney after, (66) 357
  injury of vena cava during, (107) 608
  limits for, (229) 363
  lumbar, 6 cases, and 1 case of resection for kidney varix, (13) 1236
  technic for, (231) 363
NEPHRITIS, acute, cerebrospinal fluid in, in children, (109) 1888
  acute, experimental, effect of pancreas extract on, in rabbits, (123) 360
  acute, from chilling, (60) 1431
  acute, in infants, (50) 612
  acute, operative measures in, (89) 1615
  acute, septic, (234) 363
  Ambard's uremic constant in, (85) 1615
  arterial hypertension and arteriosclerosis in relation to, (89) 275
  azotemia in, (194) 286
  balneotherapy in chronic, (92) 69
  blood-pressure with arteriosclerosis and, (87) 2169
  blood volume in normal and nephritic animals, regulation of, (28) 278, (24) 1985
  blood volume regulation in experimental, (31) 278, (29) 1985
  chronic, (56) 1795
  chronic interstitial, cystic kidney symptoms similar to, (128) 360
  chronic, urea content of blood as basis for prognosis in, (54) 66, (77) 281
  creatin and creatinin elimination in diabetes and, (93) 2169
  decapsulation of kidney in, mercurial, (48) 356
  edema with, origin of, (56) 1613
  hemorrhagic, periodical, (137) 360
  in children, latent hypertrophy of heart in, (25) 1695
  iodin and lactose elimination in various types of nephritis, comparative tests for, (67) 711
  kidney functioning in, tests of, (128) 616, (7) 1323
  kidney lesions of Asiatic cholera and acidosis and, (4) 1053
  nervous symptoms in, 57—ab, (89) 970
  parenchymatous, bacteriology of urine in, *1661
  pathology and functional diagnosis, (133) 205
  phthalein test and urea excretion in chronic, (43) 811
  procreation and, (108) 713
  sodium chlorid in, *1906, 2305—C
  surgical treatment of, (127) 63
  sweat baths, influence of, on nonprotein nitrogen content of blood in, *944
  tartrate, acute chronic, elimination of phenolsulphonephthalein in, (62) 1232
  theobromin sodium salicylate and theocin, effect of, on renal function in acute experimental, (42) 273
NEPHRITIS, traumatic, (78) 281
  treatment of, (97) 1607, 1878—ab
  uranium, acute, vascular response of kidney in, (83) 1425
  urine in, of scarlet fever and diphtheria, (9) 1058
NEPHROLITHIASIS, differential diagnosis of renal tuberculosis and, by roentgenography, *2006
  management of, (57) 707
NEPHROPEXY, (81) 281
  experiments on animals to determine influence of ureteral obstruction on kidney infections, description of author's, (31) 509
  for movable kidney, (42) 811
  right-sided, and splenopexy simultaneously, (99) 892
NEPHROPTOSIS, capsular occlusion in, (1) 1609
NERVE, acoustic, tumor of, 6 operative cases, (82) 1797
  blocking for gynecologic operations, (57) 516
  blocking in prevention of surgical shock, (118) 1608
  blocking in sciatica, (35) 1611
  canal through bone, report of experimental work to close, *1245
  cranial, rhinogenic and otogenic, lesions of 3d, 4th, 5th and 6th, (18) 278, (13) 513
  degeneration in fowls fed on unhusked rice, (123) 430
  fiber, carbon dioxid production from, in hydrogen atmosphere, (11) 508
  fibers and ganglia in limulus, comparison of carbon-dioxid output of, (65) 969
  grafting for paralysis of larynx, (104) 1888
  gunshot wounds of, (102) 358, (118) 519
  gunshot wounds of, in arms, (24) 2262
  implantation in muscle, (38) 1237
  implantation in muscle, and neurotization corrects paralysis of trapezius muscle, (127) 71
  impulse, nature of, 2135—E
  musculocutaneous, paralysis of, 2 cases, (79), 2168
  optic, atrophy, acute, double, 3 cases of, (106) 429
  optic, atrophy, diagnosis of, (72) 1797
  optic, atrophy, tabetic, intraspinal injections of salvarsanized serum in, *866
  optic, tumors, *20
  peripheral, surgery of, (49) 976
  peripheral, war wounds of, (23) 2311
  phrenic, cervical neuralgia and, (32) 1509
  phrenic, cutting of both, in tetanus cramp of respiratory apparatus, (66) 1796
  phrenic, electric stimulation of, and roentgenoscopic findings, (107) 713
  phrenic, pain in shoulder as symptom with acute surgical abdominal disease, (50) 1060
  rate of conduction in irritable tissues especially, conditions determining, (12) 508
  recurrent, neuritis of, (63) 1796
  Root, Spinal Section of: See Rhizotomy
  sciatic, stretching of, in sciatica, (90) 1063
  spinal, sciatica from affections of roots of, (48) 811
  splanchic, blood-flow through kidney after section of, effect of vagus stimulation on, (8) 1503
  splanchnic, compensatory phenomena in distribution of blood during stimulation of, (18) 888
  suture of tendons and, in field, (73) 1988
  tissue, regeneration of, in test-tube, (46) 66
  transplantation of, (45) 2166
  vagus, injury to, in operations on neck, (83) 1145
  wounds of, surgical treatment, (21) 2262
NERVOUS and mental affections, post-traumatic, (58) 2264
  and mental diseases among soldiers, (49) 2264
  and mental diseases, etiology of, in private and hospital practice, (81) 2168
  and mental diseases, prevention of, (45) 1697, (50) 1880, (22) 2165
NERVOUS and mental diseases, society responsible for, (35) 1880
  and mental diseases, teaching of, *1707
  and mental diseases, treatment, newer methods in, (105) 198
  and mental findings in feebleminded children, (76) 1881
  and venereal diseases, relationship of, (67) 806
  castration in women, and nervous disturbances, *1345
  cervical rib, double, and nervous symptoms, 1976—ab
  diseases and syphilis, (77) 1982
  diseases, causative factors in mental and, (51) 806
  diseases, diagnosis of, (111) 1608
  diseases, effects of alcohol on mental and, (77) 806, (50) 1790
  diseases, etiology of, importance of functional activity in, (45) 432, (48) 710
  diseases, parasyphilitic, and late syphilitic manifestations, intraspinous injection of salvarsan in, (1) 58
  diseases, peridental infection factor in causation of, *2027
  nephritis and nervous symptoms, 57—ab, (89) 970
  pellagra and nervous manifestations, (88) 353
  pernicious anemia and nervous manifestations, (81) 197
  serodiagnosis of mental and nervous diseases, (95) 713
  shock, physicians may testify as to usual effect of, 2157—Ml
  structures in man, absence of bony pressure on, 1596—C
  symptoms in syphilis and cerebrospinal fluid findings, relations between, (198) 362
  system and cerebrospinal fluid in secondary syphilis, (31) 1135
  system and naval warfare, (122) 1983
  system, celluloid splints in diseases of, *773
  system, central, and modern syphilis therapy from biologic point of view, 1787—ab

  reaction for tuberculosis in adults, 883
  skin tuberculin reaction, (94) 1989, 2068—ab
PITUITARY BODY: See Hypophysis Cerebri
PITUITARY EXTRACT, *476
  action of, on acute heart failure and uncompensated heart lesions, 271—ab
  and atony of uterus, (182) 286
  and epinephrin in acute infectious heart weakness in children, (147) 284
  and milk secretion, 2292—E
  effect of, on uterine contractions in labor, (73) 517
  from gravid and non-gravid animals, action on smooth muscles, (61) 67
  hour-glass contraction of uterus following use of, (111) 354
  in amenorrhea, (85) 1241
  in control of symptoms of pneumonia which favor hypotension, (11) 1604
  in obstetrics, (102) 198, (48) 509, (74) 806, (133) 893, (112) 1234, (5) 1694, 1977—ab
  intramuscular injection of, and secretion of milk, (21) 1605
  new standard for determination of strength of, (94) 970

PITUITARY EXTRACT of anterior lobe, (47) 279
  solution, 2043
PITUITRIN, (128) 63
  ecbolic action of, (90) 1697
  in intestinal paresis following laparotomy, (157) 277
  in obstetrics, 40 cases, (51) 509
  influence of, on respiration, (11) 1503
PITYRIASIS ROSEA, case of, (130) 1983
  of Gilbert, (14) 2261
PLACENTA, blood from, for transfusion, (135) 971
  centralis, cesarean section for, (83) 607
  examination of, for gaps, (64) 1511
  manual removal of membranes and, (68) 353
  praevia, (101) 708, (92) 1327
  praevia, study of fetal heart sounds in, 1978—ab
  praevia, treatment of, 290, (115) 510, *817
  prolonged retention of, after full term extra-uterine pregnancy, (134) 616
  retained pieces of, significance and treatment, (131) 283
  retroplacental hemorrhage from normally situated, (168) 206
  serum from, technic for obtaining, 502—C
PLACENTOMA and ovaries, effect of *intravenous injection of* substances affecting tumor growth on cyclic changes of, (77) 891
PLAGUE, (25) 709
  among camels in epidemic of Astrakhan plague, (79) 1615
  bacteriology and pathology of, (92) 1982
  bubonic, (34) 1789
  bubonic, early cases of, in New Orleans, (49) 1055
  bubonic, prophylaxis and treatment of, (21) 2311
  diagnosis and transmission, 167—E
  disappearance of typhus, relapsing fever and, from civilized countries, (74) 1241
  electrargol in small-pox and, (12) 199
  in Europe, incidence of, (9) 2261
  in Havana, late outbreak of, (3) 603
  in Java, (124) 616, (102) 980
  in New Orleans, 38—E, 43, 253, 792, 877, 956, 1124, 1215, 1309
  in Philippines, reappearance after 6 years, (117) 430
  in 16th century and now, 183—C
  pneumonic, histology of lesions in, (7) 1058
  situation, 175, 332, 413, 589, 695, 1404
  typhus, relapsing fever and meningitis during war, 1218.
PLANTS, action of drugs on, (33) 2165
  albumin, protective ferments against, (55) 515
  tumors in animals and, and frequency of cancer in man, 1502—ab
PLASMA, oxalated, effect of filtration through Berkefeld filter on coagulability of, (19) 1604
  removal with return of corpuscles, (98) 970
PLASMODIUM falciparum, malaria due to, (27) 709
PLASTER, adhesive, dressing for harelip operations, (100) 1243
  bandage with hare-lip operation, improved technic for, (128) 71
  cast, fenestrated, to induce local passive hyperemia, (23) 1509
  corset, mechanics of, in scoliosis, (9) 1788
  of-Paris cast in scoliosis, mechanic of, *2119
PLATES, Stilling's color test with reference to, (119) 1882
PLATINUM wire for bacteriological purposes, meteor wire to replace, 1315
PLAUT-VINCENT'S ANGINA: See Vincent's Angina
PLEOMORPHIC branching organism isolated from case of chronic rhinitis, (31) 1504
PLEURA, cystoscope for examination of, (160) 438
  effusion, mediastinal, (28) 1793
  effusion of artificial pneumothorax, 2068—ab
  effusion, pneumonia and empyema, (36) 2260
PLEURA effusion, vocal fremitus with, (137) 2170
  empyema of, treatment of, 21 cases, (138) 2170
  fluid in, percussion sign for detecting, (35) 967
  lymph flow, cause of increase and decrease of; (128) 1328
  traumatic rupture of mediastinal, (87) 203
PLEURECTOMY for chronic empyema, 2 cases of, (32) 350
PLEURISY, (76) 429
  autoserotherapy in, (252) 364
  hemorrhagic effusion in, (58) 711
  interlobar, signs of, (21) 1059
  postoperative, with effusion and empyema, (143) 1608
  treatment of emphysema and, (92) 1242
  treatment of threatening conditions in, (66) 613
  tuberculous effusion in, artificial pneumothorax for, (47) 1510
PLUMBING and health, 784—E
PNEUMATOSIS, intestinal, (32) 611, (44) 976
  intestinal cystoid, (38) 2263
PNEUMATURIA, one case, (36) 65
PNEUMOCOCCUS enteritis, ulcerative, with peritonitis following lobar pneumonia, *2268
  hemotoxin, (72) 1606
  infection and lobar pneumonia, (12) 604
  infection in rabbits, leukocytic extract in, (25) 1980
  infection of eye, modern therapy of. (111) 1882
  infection, splenectomy in, (126) 1706
  meningitis, (81) 1703, (85) 1791
  meningitis, prognosis of, (129) 2170
  methemoglobin produced by, (73) 1606
  vaccine, 1295, 1577
  vaccine in psoas abscess, (18) 354
PNEUMOGRAPH, instrument for recording respiratory movements graphically, (61) 1326
PNEUMOLYSIA, interpleural, (104) 510
PNEUMONIA, (139) 893, (95) 1507
  acute, pneumococcic arthritis following, (15) 609
  antipneumococcus serum in, (45) 274
  atypical, of infants and children, (127) 1328
  blood-pressure in, *311, (11) 604
  camphor in, large doses, (108) 2081
  childhood, (168) 973
  crisis in, (20) 1059
  epinephrin, action of, on blood-pressure in typhoid and, (112) 2032
  experimental, (66) 812
  fulminant, scrofula and status lymphaticus, (9) 1609
  heart-block in, functional, *577
  heart in, (142) 437, (89) 713, *931
  hexamethylenamin in, (88) 1615
  in cholera, (1) 1983
  leukocytic extract in, (30) 1980
  lobar, agglutination phenomena in, (25) 2259
  lobar, and pneumococcus infection, (12) 604
  lobar, symptomatology, diagnosis and prognosis, (34) 2260
  lobar, ulcerative pneumococcus enteritis with peritonitis following, *2288
  mortality and prevention, (37) 2260
  pathology and etiology of, recent developments in, (33) 2260
  pituitary extract in control of symptoms which favor hypotension and, (11) 1604
  pleuritic effusions and empyema with, (36) 2260
  purin enzymes in lung in, (85) 435
  serotherapy of, (63) 606
  simulating membranous croup, (41) 514
  staphylococcus albus, cause of, (93) 1514
  treatment, (28) 59, (42) 196, (35) 2260
  vasomotor apparatus in, (17) 888, 1303—E
  venesection in, (94) 1507
PNEUMOSAN in lung tuberculosis, (24) 894
PNEUMOTHORAX, air composition in, (84) 713
  artificial, (59) 67, (162) 206, (44) 356, (43) 889, (48) 2073
PNEUMOTHORAX, artificial, and pregnancy, *1110
  artificial, cutting adhesions in preparation for, (83) 1797
  artificial, defects and remedies for, (22) 513
  artificial, Forlanini's, (25) 1880
  artificial, in bronchiectasia, (81) 1512
  artificial, in lung abscess, (80) 1507
  artificial, in lung tuberculosis, (42) 968, (52) 969, (148) 972, (13-15) 1230, (123) 1327
  artificial, in tuberculous pleuritic effusion, (47) 1510
  artificial, lungs after 7 months of, in dog, (217) 363
  artificial, *new applications of*, (22) 1605
  artificial, pleural effusions of, 2068—ab
  artificial, Santoro prize to discoverer of, 1865
  artificial, technic for, (94) 282, (141) 284, (16) 508, (56) 612, (92) 1616
  Association, proposed, 49—C, 263—C
  for hemoptysis, (25) 605
  spontaneous, 348—ab
  treatment of acute threatening conditions with, (74) 812
PODOLAX, 595—P
PODVYSSOTSKY, V. V., works of, (174) 439
POHL'S method for removing blood, 340
POISON containing bottle, new, (88) 2074
POISONING, benzol, blood findings in acute and chronic, (121) 2170
  boric acid, from dressing, 593
  carbon monoxid, in Senghenydd explosion, (8) 513
  carbon monoxid, on steamship, (76) 1511
  cedar, 1872
  chineonal, fatal, (65) 1431
  copper, chronic, from alloy filling of tooth, (80) 812
  egg, and asthma in children, (26) 1880
  ergot, isolation of ergotinin crystals from organs in acute, *1203
  fish, action of digestive ferments on, (218) 362, (96) 1989
  fish, bacillus of, (85) 1146
  food, from eating canned string beans, (29) 1696
  lead, electrolytic prevention of, (25) 1611
  lead, electrolytic treatment of, (26) 1611
  lead, in smelting and refining industry, 1482—E
  liability for patient under own physician getting, in hospital, 1784—Ml
  luminal, case of, (214) 362
  male-fern, fatal, in clinically latent Addison's disease, (47) 2264
  male-fern for vermifuge, unusual case of, fatal, *242
  meat and paratyphoid, (105) 1888
  mercuric chlorid, (52) 1231
  mercury bichlorid, with recovery, (75) 429, (75) 1982
  mushroom, (18) 427, (136) 2170
  novocain, (44) 1697
  potassium permanganate, fatal, (57) 1511
  snake, symptoms and treatment, (90) 1982
  veronal, chronic, (75) 2168
  wild sweet potato, 1315
POISONS, action of, on blood vessels of inflamed tissues and of epinephrin in peritonitis, (98) 1990
  action of, on blood-vessels of liver, (97) 1990
  action of, on blood-vessels of lungs, (255) 364
POLIOMYELITIS, (185) 973
  acute anterior, (5) 426, (79) 509, (120) 1426, (8) 2164
  acute anterior, and Landry's paralysis, (114) 198
  acute anterior, entitled to recover for quarantining, 1132—Ml
  acute anterior, *entrance of* infective agent of, into body, 1396—E
  acute anterior, localization of virus and pathogenesis of, (38) 1136
  acute anterior, surgical treatment, (21) 64, (130) 971, (86) 1425
  acute anterior, tendon transplantation after, 1229—ab
POLIOMYELITIS, acute anterior, treatment, (80) 509
  acute anterior, treatment of deformities following, (1) 63, (93) 1327, 1501—ab
  adult type, (1) 1230
  adult type, and acute ascending paralysis of type of Landry, (79) 1697
  celluloid splints in acute cases of, (37) 709
  epidemiology of Buffalo outbreak, 424—ab
  human, comparison of lesions of nervous system in distemper of dog with, (19) 1985
  transmission of, by bite of lyperosia irritans, (24) 803
POLISH physicians meet, 589
POLYADENOMA, case of, (123) 63
POLYARTHRITIS in children, chronic, (59) 2161
POLYCYTHEMIA, experimental, (61) 977
POLYDACTYLISM, family history of, (19) 1329
POLYNEURITIS, diphtheria followed by, cured by tonsillectomy, (97) 69
  diphtheria followed by, with pains, ataxia and paralysis, (60) 1238
  uremic, (247) 363
POLYPUS, intestinal, with 3 intussusceptions, (108) 510
  larynx, recurring, with *tetany*, (23) 273
  nasopharynx, (60) 356
  nose, 1501—ab

  and tuberculosis, *1720

PRACTICE OF MEDICINE: See Medicine, Practice of
PREGNANCY, adrenal insufficiency during, (44) 201
  albuminuria in, treatment of, *157
  amputation of uterus to arrest, and prevent conception in lung tuberculosis, (37) 1510
  appendicitis in, (201) 362
  artificial pneumothorax and, *1110
  artificial termination of, and sterilization at one operation, (93) 1704
  bacillus coli communis infection complicating labor and, medical and surgical treatment, (7) 198
  cholelithiasis and, 4 cases, (73) 1790
  cholesterin metabolism of, experimental study of physiology and pathology in, (79) 435
  chorea during, (116) 519
  contracted pelvis in labor and, treatment, (5, 6) 1508
  corpus luteum, influence of, on breast and uterine mucosa during early stages of, 32—E
  dermatosis, Ringer's solution in, (181) 286
  dermographism of, (27) 975
  diabetes and, (87) 1798
  diagnosis of, (77) 429
  early sign of, (106) 615
  extra-uterine, (68) 429, (66) 509, (95) 608
  extra-uterine, abdominal, (24) 2310
  extra-uterine, advanced and full-term, (39) 2263
  extra-uterine, advanced, 3 cases of, (44) 279
  extra-uterine, advanced, with tuberculous peritonitis, (16) 64
  extra-uterine, final results of operations on, (139) 276
  extra-uterine, in stump following ovariotomy, (19) 1884
  extra-uterine, lithopedion in, (99) 1507
  extra-uterine, prolonged retention of placenta after full term, (134) 616
  extra-uterine, ruptured, complicated by splenomedullary leukemia, (5) 1609
  extra-uterine, ruptured during early months, treatment of, (74) 517
  extra-uterine, ruptured, early diagnosis of, (69) 890
  extra-uterine, ruptured, 5 to 6 months, laparotomy, (27) 1700
  extra-uterine, ruptured in early months, (40) 2263
  extra-uterine, ruptured, 100 cases, recovery, (64) 1060
  extra-uterine, ruptured tubal, postmortem specimen of, (18) 1884
  extra-uterine, treatment of early, (54) 1055
  extra-uterine, tubal, anatomic study of early, (4) 1694
  extra-uterine, with living child at term, (84) 1513
  extra-uterine, with polypoid chondrofibroma of fallopian tube, (12) 888
  extra-uterine, with prolonged retention of fetus, (19) 1508
  extra-uterine, with rupture of large intestine, (45) 1055
  fat-lipoid content of blood increased in, 1299—E
  fecundation and conception, (70) 1326
  fibroids of uterus complicating, hysterectomy for, (83) 607
  hydramnios, acute, occurring with uniovular twins, (18) 64
  hypophysis in, (40) 2312
  imagined, (63) 357
  intra-abdominal hemorrhage complicating normal, (45) 2072
  kidney trouble during, eye symptoms with, (191) 362
  Korsakow's psychosis in, (33) 1324
  management of normal labor and, (43) 1981
  metabolism changes in, (170) 285
  morbus cordis complicating, cesarean section under spinal anesthesia for, (15) 64
  morbus cordis complicating, 2 cases treated by hysterotomy under spinal anesthesia, (14) 974
  myoma and, (40) 1238
  myomectomy followed by, (28) 514
  neuritis, (149) 206
  ninhydrin reaction in urine and urine dialysates in, (16) 887
PREGNANCY, nutrition in development and, 244—E
  pyelitis in, (99) 2169
  reaction, hemolysis of streptococci, (180) 286
  removal of both breasts with subsequent, and absence of labor pains, (7) 1694
  Roentgen rays and, (48) 515
  serodiagnosis, Abderhalden, (131) 63, (163) 206, (52) 352, (186) 362, (241) 363, (13) 426, (130) 512, (72) 978, (41) 1142, *1172, (28) 1231, 1500—ab, (57) 1982
  serodiagnosis, Abderhalden, limitations of, *370
  serodiagnosis, Abderhalden, negative excludes, (53) 1885
  serodiagnosis, Abderhalden's, value of, (89) 353, *371
  serodiagnosis of cancer and, (5) 708, (3) 973
  serodiagnosis, proteolytic, (65) 67
  sero-enzymes in disease and, (114) 1983
  seroreaction, decidua responsible for, (67) 1144
  serum turbid and opalescent in new-born infant and in, (144) 284
  syphilis as complication of, (96) 608
  termination before third month, when justifiable, (5) 349
  tests, conjunctival and skin, no practical value to, (83) 517
  tetanoid symptoms in, (165) 285
  toxemia of, duodenal enema in, (91) 429
  toxemia of, eye manifestations of, *25
  toxemia of, total non-protein nitrogen of blood in, (9) 1695
  toxemia of, treatment of, with placental serum, *158
  toxicity of urine, serum and colostrum in labor, puerperium and, not proportional to clinical picture in eclampsia, (64) 812
  tuberculosis and, (114) 814, (25) 1329
  tyrosin crystals in urine of normal, (114) 1327
  uncinariasis and, dangers, (112) 2075
  urine, bacterial content in, (169) 285
  uterus bicornis bicollis, 6 months, right horn, pyometra left horn, (17) 64
  vaginal douches, medicated, during parturition and, (53) 1331
  vomiting, pernicious, treatment of, (76) 708
  vomiting, uncontrollable, (185) 362
  unusual case of, (68) 275
PRESBYOPIA, mechanism of development of cataract and, (55) 1470
PRESCRIBING and sale of morphin, unlawful, 2157—Ml
  in England, war and economics of, 1484—E
PRESCRIPTION, (47) 1981
  criticism of, 1971
PRESENTATION, breech, at 8½ months complicated by fibroids, confirmed by roentgenograms, (122) 63

  transportation of German, 1965
  transportation of, improvement of conditions of, 1591
  transportation of, in France, 1491
  treatment of, 1966
  volunteer assistance for sick and, history of organization in various countries, (112) 1705
WOUNDS, abdominal, penetrating, *1165
  acute emphysematous gangrene, (11) 2261
  antiseptic powder for, before suturing, (95) 813
  cancer on hand after battle, (45) 1330
  character of, 1310
  dumdum bullets, (80) 2079, (17) 2311
  dura, in operation on mastoid process, treatment of, (86) 429
  during 3 weeks' fighting in Flanders, (17) 2261
  electric light in infected gangrenous or torpid, (48) 1701
  epigastric, non-infected, delayed union in, (161) 2070
  eyes, emergency treatment, (45) 1701
  eyes in war, (57) 2264, (12) 2311
  from French projectiles, (41) 1986
  gangrenous, military, treatment of, 1967, 2145
  gunshot, (99) 358, (24) 1236
  gunshot, abdomen, (98) 353, (47) 1060, (50) 1137
  gunshot, abdomen, in war, treatment of, (87) 1333
  gunshot, abdomen, with rupture of pregnant uterus, *243
  gunshot and bayonet, of stomach, (48) 1605
  gunshot, aneurysms caused by, (101) 358
  gunshot, bladder, (91) 1697
  gunshot, blood vessels, (100) 358
  gunshot, bones and joints, (39) 1510
  gunshot, brain, (137) 893
  gunshot, brain, surgical indications in, (103) 359
  gunshot, cavernous plexus, (157) 1699
  gunshot, compression with rubber sponge to arrest hemorrhage from, (77) 1511
  gunshot, cranium, (104) 358
  gunshot, face and neck, (105) 359
  gunshot fractures, dressing for, (61) 1430
  gunshot, gravid uterus, (81) 353
  gunshot, heart, (44) 1142, (89) 1333
  gunshot, heart, distant results of suture, (39) 350
  gunshot, heart, heart block from, (65) 1886
  gunshot, immobilization of fracture from, (53) 1701
  gunshot, infection of, (48) 1061
  gunshot, intestines, (67) 2167

WOUNDS, gunshot, large joints, (108) 359
  gunshot, lungs, (31) 2263
  gunshot, malpractice in treatment of, 800—Ml
  gunshot, nerves, (102) 358, (118) 519
  gunshot, nerves in arms, (24) 2262
  gunshot, skull, experiences with, (55) 2264
  gunshot, spinal cord, (11) 2310, (31) 2311
  gunshot, spine, (103) 1607
  gunshot, spleen, patched with omentum, (49) 1238
  gunshot, stomach, (9) 2310
  gunshot, thorax and abdomen, (106) 359
  gunshot, thorax or abdomen, is operative treatment required, (22) 809
  gunshot, treatment of, (76) 1331, (75) 1511
  gunshot, 200 cases, (95) 436
  healing of, to hasten, (32) 2263
  hot air jet in burns and granulating, (79) 1797
  in war, advice to surgeons with regard to, 1043
WOUNDS, infected, (41) 2166
  intestines, shell and bullet, (3) 2310
  jagged, of rebounding bullets, (46) 2077
  jaws, dental prothesis for, (71) 1886
  joints and fracture of bones during Balkan war, (28) 1059
  massage in after-care of fractures and, (51) 1701
  nerves, surgical treatment, (21) 2262
  non-infected epigastric, delayed union in, 1320—ab
  of present campaign, (37) 1700
  of vertex by way of base of skull, (145) 72
  peripheral nerves, during war, (22) 2311
  protector, new self-retaining abdominal retractor, and, (149) 277
  severity of, and speed of bullet, (33) 1794
  septicemia from, in war, (16) 2311
  shell, in modern naval warfare, (29) 1884
  shell, of bladder, (36) 2311
  stab, of brain through base of skull, (73) 711
  stab, of heart, sutured, (172) 439
WOUNDS, sugar and charcoal as dressing for, (165) 361
  suppurating, open treatment for, (77) 2080
  treatment as established by Lister and subsequent modifications, (2) 2261
  treatment of, received in battle, 1868, (1) 2261, (12) 2262
  vaccines in healing of, (90) 275
  various kinds of, in battle, 2242
  varnish in treatment of, (27) 2311
WRIGHT, A. E., recommends typhoid vaccination, 1124
  solution, (71) 197
WRIST, crushing of, (69) 898
  fracture of, (107) 1990
WRITING, letters written upside down and backwards, (18) 967
WRY NECK: See *Torticollis*

X

X-RAYS: See Roentgen Ray
XANTHIN, metabolism of isomer of, and some isomers of methylxanthins, (67) 1232

YAWS: See Frambesia
YEASTS, staining of, by Gram's method, (47) 707
YELLOW FEVER, arsenization to prevent, 689—E
  commission, 2216—ab
  duck as preventive against malaria and, *1203, 1410—C
  endemic in tropical and Atlantic region, (39) 509
  in Brazil, (251) 364
  in Mexico, (17) 1420
  suspects, 1964
YELLOW pigments, natural, occurring in body, 948—E
  plant pigments, carotin and xanthophylls, fate of, in the body, 1304—E

Z

ZADIG, method of, in practice of medicine, (22) 509
ZINC oxid to render finger prints visible, (112) 1064

AUTHOR INDEX

In this Index, as in the Subject Index, the black-face type refers to reading-matter in THE JOURNAL; the light-face to articles in other journals and not abstracted in the Current Medical Literature Department. The asterisk (*) preceding the page reference indicates that the original article appeared in THE JOURNAL. The numbers in parentheses indicate the numbered paragraphs on the pages referred to. The numbers not in parentheses indicate pages.
